PART 1: Review Comments

	Reviewer's comment	**Author's comment** *(if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)*
Compulsory REVISION comments	**The article is original and the subject matter is interesting. However, you need to rephrase some parts.** **1) Formatting is without pattern;** **2) The pictures are very bad. The information is confusing, small. The author chose the wrong chart to present data on population fluctuation of mites and damage in different cultivars. In this case, you can not use a line.** **3) Repeat in the text all the information in the tables.** **4) describes the results very well but argues little. Basically, it merely mentions that environmental differences are responsible for the responses in the study. You need to explain how that happens. The discussion needs to be thorough. If rainfall influences, explain why. What changes in the environment? What is the influence on the physiology of the mite? Do not forget that the ecology of populations and the study of ecosystems is not limited to biotic and abiotic factors in isolation. Consider in your discussion the interaction between individuals and the environment.**	All Noted
Minor REVISION comments	There are many suggestions in the PDF file.	
Optional/General comments
