SDI Review Form 1.6

Journal Name:	**American Journal of Experimental Agriculture**
Manuscript Number:	**Ms_AJEA_19985**
Title of the Manuscript:	**Molecular Characterization and Antibiotic Resistance Profile of Bacteria Associated with Clarias gariepinus (Burchell, 1822) From Ebute Iboro Location on Yewa River**
Type of the Article	**Original Research Article**

General guideline for Peer Review process:

This journal's peer review policy states that **NO** manuscript should be rejected only on the basis of '**lack of Novelty**', provided the manuscript is scientifically robust and technically sound.
To know the complete guideline for Peer Review process, reviewers are requested to visit this link:

SDI Review Form 1.6

PART 1: Review Comments

	Reviewer's comment	**Author's comment** *(if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)*
Compulsory REVISION comments	**As a general comment the manuscript is poorly written., often there is no concordance between gender and number. Much of the information is redundant or unnecessary. I have some more detailed comments:** - **Lines 15-17.: Line should be rewritten. Authors mention three types of bacteria but thay show four of them** - **Line 22: DNA extraction and sequencing should not be included as key words. Aquaculture would be better.** - **Lines 25-27: Line 26 is not the consequence of what is said in line 25** - **Line 28 should read: it limits the degree…** - **Line 72: some details are unnecessary** - **Line 82: numerals should be separated from units** - **Figue 1 is redundant with table 3, same as table 4 and figure 2** - **Figures 2 and 3: there are no units in axis Y** - **Plate 1 is not necessary** - **Line 131: homogenize the letter type for bacteria** - **Line 135: No clustering analysis is shown** - **There is no mention on the criteria used to determine the sensitivity to antimicrobials ¿CLSI?** - **References are not uniform.** -	

SDI Review Form 1.6

Minor REVISION comments		
Optional/General comments	Since bacteria were sampled from different anatomic areas from healthy fish, the demonstration that they are sensitive or resistant to a particular antibiotic does not necessarily help to understand how they will behave in a lesion. Or during an outbreak Bacterial resistance to antibiotics is dynamic and can be transferred by mobile elements. Authors should make a comment about this
