SDI FINAL EVALUATION FORM 1.1

PART 1:

Journal Name:	International Journal of TROPICAL DISEASE & Health
Manuscript Number:	**Ms_IJTDH_36788**
Title of the Manuscript:	**MALE PATTERN INFERTILITY IN A REFERRAL HOSPITAL, SOUTHERN NIGERIA**
Type of Article:	**Original Research Article**

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	**Authors' response to final evaluator's comments**
The abstract has been changed. **No improvement in the background of the manuscript, except for the addition of the two words, (idiopathic infertility), in parentheses.** **The aim of the study was described by saying that the pattern of seminal fluid parameters (sperm concentration, motility and morphology) was evaluated, but in their answer the authors declared that the aim of the study was not to describe anomalies not to cumbersome the manuscript!** **Morphology anomalies are clearly described in simple routine spermiograms and the study would be improved by a potential classification of the kinds of anomalies (such as immature, double headed, or so) just to analyse if the age could influence the correct morphological asset of the cells.** **The simple statement that the percentage of men (30-49 years old) with poor sperm count was statistically higher than in other country should be improved, since no information about related effective infertility was reported and no further potential cause/effect hypothesis such as life style, or any other potential cause was proposed.**
