PART1: Review Comments

	Reviewer's comment	Author's comment <i>(if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)</i>
--	---------------------------	---

<u>Compulsory</u> REVISION comments	The paper needs significant improvement in English language. There are many cases where a semicolon or a full stop appears in places where they are not required. The theoretical review framework is consisted by only a few references. For example, in lines 118 and 119 the statement needs additional references. I think that a pearson correlation approach for time series data is not adequate for testing their relation. A very useful approach would have been testing the Granger causality among all the variables. Table 3 is not needed. The p values should included in the text together with the value of correlation. However, I would recommend, according to my previous comment, to eliminate this analysis and replace it by Granger causality. I also think that my view for causality is supported by the last figure.	
<u>Minor</u> REVISION comments		
<u>Optional/General</u> comments	The paper is interesting and it could be published if better English are used and additional references are included.
