

Editor Comment:

Three comments that were not addressed:

Authors need to clearly respond to reviewer's comment about whether confirmatory ELISA was performed on all participants or just those who were positive by the rapid test.

Need to report discussion in past tense.

Need to document statement that syphilis is the oldest known STI.

Author's Feedback:

All the participants were screened with RTK and all confirmed with ELISA. We discovered that all those that were positive to RTK were also positive to ELISA but some that were negative to RTK were positive to ELISA. And individuals positive to any of the infections were referred to the appropriate quarter.

Need to report discussion in past tense has been taken care of.

Need to document statement that syphilis is the oldest known STI has been taken care of.
