Subject: RE: Request for Editorial decision for manuscript number 2014_IJTDH_14198

The objective of the study "Utilization of HIV Testing and Counseling Services by Men in the Bolgatanga Municipality" is to determine the use of HIV testing and counseling among men living in Ghana. The objective of the study is valuable from a public health perspective.

The paper is well organized, the questions well posed, methods appropriately chosen and described. Collected data respond to the objective of the study. Data are clearly reported. The statistical analysis could be improved. The authors used the chi square test for the analysis; this is a very crude statistical tool. No adjustment of the analysis for potential confounding factors has been performed. However, because I have not managed the editorial process, it is inopportune to ask now for further revisions.

Finally, I would be in favor to accept the paper for publication.
