

SDI FINAL EVALUATION FORM 1.1

PART 1:

Journal Name:	Asian Journal of Agricultural Extension, Economics & Sociology
Manuscript Number:	Ms_AJAEES_23478
Title of the Manuscript:	Determinants of Access to Agricultural Extension Services: Evidence from smallholder Rural Women in Northern Ghana
Type of the Article	Original Research Articles

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	Authors' response to final evaluator's comments
The author responds to some of the comments, that's okay. But, there are still issues which need attention before final acceptance for publication. The choice of logit over probit is not well justified. Basically, the two models are similar except that Probit uses cdf and logit used logistic transformation. Both models are capable of capturing categorical and continuous variables. To my knowledge, the author can simply state that logit is preferred for its simplicity. I also do not agree with the model specification. (1) The author should start with the linear form and show the log-transformed model (eq 1) (2) The model specification in eq 2 is not appropriate. The author can state the variables of interest in the paragraph preceding eq 2. The justification for the inclusion of explanatory variables is adequate to this level.
