

Editor's Comment:

Regarding that manuscript no. 2016-AJEA-28260 entitled "Phenotypic variation analysis of sweet potato germplasm resources from different agro-climate zones", I went thoroughly through the three reviewers comments and corrections and back to the revised manuscript by the author and I found the followings:

- In general the subject is important to the scientific community and other researchers in terms of the methodology and handling of the research professionally.
- Being written by a Chinese scientist there was some linguistic problems but has been cured by the reviewers to a large extent and became acceptable.
- Most of the reviewers' comments are valid and have been considered by the author in his/her response.
- I personally am convinced with the responses delivered by the author in most cases. The author was highly responsive to all comments of the reviewers and he/she was quite well in his answers to the enquiries of the reviewers and did all the required corrections in a scientific and professional way.
- However, I suggest to add "in China" at the end of the Title as was suggested by one of the reviewers.
- In conclusion, based on my opinion and also on the reviewers evaluation and grading, that this piece of work is highly appreciated and could be of great help to other researchers and to the whole scientific community and I recommend this research for publication in American Journal of Experimental Agriculture.
