

Journal Name:	Asian Journal of Environment & Ecology
Manuscript Number:	Ms_AJEE_42483
Title of the Manuscript:	PAPILIONOIDEAE OF AN AREA OF VEGETATION IN NORTHEASTERN BRAZIL
Type of the Article	Original Research Article

General guideline for Peer Review process:

This journal's peer review policy states that **NO** manuscript should be rejected only on the basis of '**lack of Novelty**', provided the manuscript is scientifically robust and technically sound. To know the complete guideline for Peer Review process, reviewers are requested to visit this link:

PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
<u>Compulsory</u> REVISION comments	The authors must to better describe the field methods. How have they collected the data? What is the area covered by the survey?	The collection period, the references with protocols followed for sampling and herborization, and the way the samples were taken to compose the data, as well as a better description of the study area and the sampling sites were added in the material and method section. .
<u>Minor</u> REVISION comments	See in the main file of the manuscript: the title Page and the second page.	It was verified and standardized
<u>Optional/General</u> comments	I find that the 21 species described in this paper, are insufficiency if we considered a total of 503 genera and 14,000 species surveyed in Brazil.	It was clarified in the results that the sampling is at the regional and not national level, and with the values sampled the data become relevant since it presents considerable percentages of wealth for genus and species when compared with the state data, and considering the subfamily the data are added giving greater significance and increasing the incipient data for the region.
