

REASONS WHY STUDENTS STUDY MEDICINE: VIEWS OF STUDENTS AT DELTA STATE UNIVERSITY ABRAKA, SOUTH- SOUTH NIGERIA

KEY WORDS: Reasons; Medicine; South-South Nigeria

ABSTRACT

Background: The demand to study medicine in Nigeria is very high thereby putting lots of pressure to the University authorities because of inadequate space and provision to accommodate the large number of applicants.

Objective: The aim of this study was to determine the factors motivating students and influencing their desire to study medicine and proffer solutions to reduce the population of applicants to medical schools.

Methodology: Self-administered questionnaires were used to collect information from 311 medical students of Delta State University Abraka, Nigeria. Data collated and analysed using IBM SPSS version 22 software.

Results. Three hundred and eleven students were interviewed comprising 193 males (62.1%) and 118 females (37.9%). The mean age was 23.47 ± 3.92 years. More than 90% of the students were Christians and the same proportion were single. The Urhobos were of the majority. Reasons for studying medicine were: want to save lives (58%), doctors are respected (26%), other reasons such as passion for medical profession (12.8%) and desire to be rich (3.2%). People's influences from friends, teachers and even family members were minimal as

34 51.8% of respondents took a self-decision to study medicine.

35
36 **Conclusion:** The reasons why the students study medicine were quite good and
37 justified and hence they should be encouraged to fulfil their dreams.

38
39 Government should establish more medical schools to accommodate the
40 increased demand to study medicine. This will promote the production of more
41 medical doctors and reduce the current poor and embarrassing doctor-to-patient
42 ratio in Nigeria

47

48 INTRODUCTION

49 Medicine is one of the most sought after courses as many students apply to
50 study Medicine and Surgery (MBBS) every year during Joint Admissions and
51 Matriculation Board (JAMB) examinations.

52 Despite the over twenty-five medical schools in Nigeria¹ yet the number of
53 applications received in each medical school are so much that the quota given to
54 each school is highly and seriously exceeded. There are just 2,435 quotas for
55 medical training in the fully accredited medical schools in Nigeria. If you add
56 the 300 in the partially accredited medical schools, you have 2,735 spaces.

57 Meanwhile, every year more than 100,000 candidates apply to study medicine
58 in Nigerian medical schools¹. At the last Post University Tertiary Matriculation
59 Examination (PUTME) screening exercise of Delta State University (DELSU)
60 in July 2016 for Medicine course about two thousand candidates came for a
61 space meant for about 50 students. This scenario places extreme pressure on the

62 University authorities to the extent that they are often coerced to admit more
63 than their quota thereby over-stretching the few human and material resources
64 available to train the students. At times, the rich and the mighty use their
65 powerful influence to arm-twist the university authorities into admitting their
66 not-so-good wards and children thereby denying the better students admission
67 opportunities. These “bad students” constitute all forms of nuisance in the
68 medical school and a good number of them end up being withdrawn from the
69 medical school due to poor academic performances. If they manage to graduate,
70 they throw caution to the winds and indulge in lots of unethical practises
71 thereby bringing the revered medical profession to disrepute.

72 Studies are few on the reasons why students chose to study medicine
73 and surgery. While in primary school and secondary schools, a choice of career
74 has been a basic issue[2]. The issue of poverty has played an important
75 determining role in the opportunities available to all. The income level of
76 secondary school families may determine what career a student chooses during
77 a specific time in the student’s life; choices that will determine a large part of
78 that student’s future. Some students will have to budget education according to
79 their personal income [3]. People desires from a career are different, many
80 people desire high income; others want adventures while some others want to
81 serve people to make the world a better place [4]. It has been shown by a study
82 that the family; the ability of the learner self to identify his/her preferred career

choice; and teachers were significant factors that influence the career choice and aspirations of students [5]. Parental influences have been recognized as a determining factor in students' career decision-making and Sometimes such influence tends to ignore the child's personal interest [6,7]. Stanley (1996) observed that prestige of a profession was a strong motivating factor influencing students in making career choices [8]. Peer group influences have also been identified [9]

A study showed that **13.2%** of medical students/residents choose a career in surgery because of future employment, career opportunities, and intellectual challenge and some of those aspiring to a career in surgery placed most emphasis on prestige [10]. Personal satisfactions are likely influential factors with financial rewards being the least significant. Surgery is also popular in Nigeria despite their increased awareness of risk of HIV/AIDS associated with surgery[11]. According to Katherine Grindley, an Elsevier Australian medical student ambassador, "For me, medicine is about the irresistible combination of altruism, intellectual challenge and the dynamics of our knowledge base"[12]. Plenty of opportunities upon graduating, Working with people, Team work, Respect in society, A great need for doctors and Safe job/career have all been adduced to be reasons students chose to study medicine[13]

AIMS AND OBJECTIVES

Whenever students are asked why they study medicine, the stock standard answer is usually because they want to help people/save lives – but in essence, this makes medicine no different from any other career involving health care. The aim of this study is to determine factors influencing students' application to study medicine with a view to proffering solutions and stemming the tide in number of applications into the medical schools.

MATERIALS AND METHODS

Self-administered structured questionnaires were distributed among all the medical students who met the inclusion criteria. These criteria were, being a medical student and giving of consent. The questionnaires enabled us obtain the necessary information concerning the students such as: General Biodata:(Age, Sex, Tribe, Religion and Marital Status), Primary School attended, whether any member of the family is a medical doctor, why did he/she decide to study Medicine and who influenced his/her decision to study medicine?

Ethical approval

An approval of the study was obtained from Health Research Ethics Committee (HREC) of Delta State University Teaching Hospital, Oghara. The participants/respondents of the study were informed that their participation was entirely voluntary and they were free to withdraw from the study at any point.

Data analysis

The data collected were entered in SPSS version 22 software (IBM SPSS Statistics for Windows, Version 22.0. Armonk, NY: IBM Corp). Frequency

distribution tables, bar charts and pie charts were used for presentations of selected variables.

RESULTS

This work was a cross-sectional study which was carried out at the medical school of Delta State University Abraka. Three hundred and thirty-one(331) students were interviewed. Table 1 shows the general biodata of the respondents. The mean age was 23.47 ± 3.92 years. The youngest student was 17 years while the oldest was 42 years. Majority of the students, (Fifty eight point five percent) belonged to the age bracket of 20-24 years. This was followed by age range 25-29 years representing twenty four point four percent. Only three students (1.0%) were in the least age bracket which happened to be the oldest age range(40-45). Male medical students were more than the females represented by 193(62.1%) and 118(37.9%), respectively. In terms of the tribal affiliations, the two major tribes of the students were the Urhobos, 144(46.3%) and the Igbos, 67(21.5%). The Isokos and Ukwuanis were 31(10%) and 16(5.1%), respectively. The Binis were only 11(3.5%). Three hundred and eight students (99%) were Christians.

Three hundred and eight students (97%) were single while only 8(3%) were married. One hundred and eighty two students (58.5%) attended private schools, 116(37.3%) attended public school while the remaining 13 students (4.2%) attended the mission schools. Seventy three students (23%) have a

168 medical doctor in their families and the relationship with the doctor is shown in
 169 **fig.1**. Father(16.4%), mother(2.7%), brother (16.4%), Sister(15%),
 170 others(49.3%). **Fig.2** showed the reasons the students chose to study medicine.
 171 The main reason was that the doctors save lives 181(58%), this was followed by
 172 the fact that doctors were well respected in the society 80(26%). There are other
 173 reasons given by 40 students (12.8%). Surprisingly, only 3.2% of the students
 174 decided to study medicine because of monetary gains. Fig 3 showed the level
 175 influence played by individuals in the choice of medicine. About half of the
 176 respondents(51.8%) chose to study medicine based on self-decision without
 177 anyone's influence. Fourteen point one percent were influenced by their mother
 178 while the father's influence was 16.1%. The influence of the siblings was 4.2%,
 179 friends 4.8%, teachers 2.9% and other influences was 6.1%

DISCUSSION

This study was carried out among young undergraduate university students.

This reflected in the age distribution of the respondents where almost all the

population sample (98%) were below 35years. It also reflected the changing

landscape of higher education pattern of University admissions¹⁴ these days

students are admitted in their teens unlike in the 1960s/70s where university

admissions were not common and when it occurred the students were much

older. In this study, there were more males (62%) than females(38) in the ratio

of 1.6:1. This was in contrast with what obtains in Europe. For example, in

Northern Ontario School of Medicine, women out-number men at most of the

medical schools¹⁵. In Nigeria, medicine is a very demanding course and takes a

minimum of 7-8 years for graduation. Female University education is still

210 seriously down-played by many cultures in Nigeria. Only 3 of the respondents
211 are married. This was not a surprise as marriage needs quite some level of
212 independency and financial stability. The students still depend on their
213 parents/guardians for sustenance in medical school. The tribal distribution
214 reflected the major tribes in Delta state. The Bini were few because they were
215 the main tribe in neighbouring Edo state. Again, Edo state has three medical
216 schools therefore the Binis have minimal need applying to **Delta State**
217 **University (Delsu)** to study Medicine. In terms of religion, 99% of the
218 respondents were Christians. This again did not come as a surprise. Nigerian
219 citizens are divided along two major religions, the northern muslims and
220 southern christians. The religion in this study is skewed into Christianity as the
221 study was done in southern Nigeria.

222 As for the primary school attended by the students, majority attended
223 private schools. This is the trend of school choice in Nigeria because public
224 schools which are owed by the government were not adequately maintained
225 and funded. The government schools are bedevilled by incessant strike actions
226 by the teachers with various degrees of interruptions to the academic
227 programmes. The importance of this to this study is because the government
228 schools have more qualified teachers who are better in the knowledge of career
229 choices than their private schools counterparts and hence the students are
230 expected to get a better career guidance and counselling from government
231 schools. Government should do the needful to reverse this trend of more private
232 school patronage.

233 Having a relative or a family member as a doctor seem not to play a
234 determining factor in the choice of medicine as a course. This was because only
235 twenty-three percent of the students had a medical doctor as a member of their
236 family. Among those whose relatives were doctors, this study showed that
237 majority were neither the parents nor the siblings rather they were the aunties,

uncles and cousins. Majority of the students said the reason why they chose to study medicine was because doctors save lives and they wanted to do the same. This has earlier been one of the reasons motioned for choosing medicine⁴. Monetary gains and becoming rich were the least reasons why the students came to the medical school. This should be applauded. One would have thought the desire to make money was the driving force to study medicine. Demand of money by medical doctors before medical services are rendered should be discouraged because people have lost their lives on account of this unethical practise. Apart from desire to save lives, prestige and respect accorded to medical doctors by the society was another reason the students applied to study medicine, this was in agreement with one of the reasons behind career choice among college students[8]. A good proportion of the respondents (13%) had other reasons why they decided to study medicine, these include: passion for the medical profession, medicine being a challenging and dynamic course, empathy for patients suffering from sickle cell anaemia and medicine as an adventurous discipline. We wanted to know the main influential person in the choice of medicine among the students. Majority of the students said they were in medical school by their own freewill and self-decision contrary to the expectations that parents have a strong influence on the career their children choose[6,7]. Again this is another good sign and quality of a good doctor-to-be. This self-decision promotes doggedness in the students to withstand the stress and rigors of medical school and training.

CONCLUSION/RECOMMENDATION

262 There is high demand to study Medicine/Surgery and this makes Medicine one
263 of the most competitive courses in Nigerian Universities. Findings from this
264 study showed the reasons given by the students were quite laudable. Self-
265 decision, desire to save lives, respect from society and less emphasis on
266 monetary gains were the motivating factors. The society needs such selfless
267 doctors. Nigeria is currently posting a poor doctor-patient ratio of 1:3500
268 against the World Health Organization (WHO) standard of 1:600. We
269 recommend that government should establish more medical schools and make
270 funds available to properly run the existing medical schools in Nigeria.
