

SDI FINAL EVALUATION FORM 1.1

PART 1:

Journal Name:	Asian Journal of Medicine and Health
Manuscript Number:	Ms_AJMAH_39244
Title of the Manuscript:	PATTERN AND OUTCOME OF IATROGENIC GENITOURINARY FISTULA FROM OBSTETRIC AND GYANAECOLOGICAL SURGERIES IN A TERTIARY INSTITUTION, NORTH-WESTERN NIGERIA
Type of Article:	Original Research Article

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	Authors' response to final evaluator's comments
I have gone through all part of the article and found clearly accepted change as I direct to do so but only part of tools used for analysis during the study period did not clearly mention either SPSS or EPI info e.t.c I conclude: The methodology analysis is inappropriately presented after missed the association result table, there must be a final table showing the association between dependent variables and outcomes, at least to get any significant association in this study, simply because there was a big sample size which can give as accurate associations analytical significant. I recommend that authors should add the association result table because is very important and also should add this objective of the association at the methodology part of his/her study objectives.	It is not possible for me to run an association as I did not enter data for the patient with fistula following prolonged obstructed labour to be able to compare outcome of the two groups. This study is a preliminary study that is aimed at determing the prevalence and the repair outcome only. I used SPSS version 22 to get frequencies and means and correction has been effected in the resubmitted manuscript. Thank you
