

Editor's Comment:

In my opinion the paper still needs revision, as follows:

1. Several corrections are required: **Fig. 3. comparative study** (capital); keiselgel instead of kiselgel; whereas instead of whereas; barburic acid and many more....**Fig 2 Micheal addition instead of Michael addition**
2. Experimental (general synthesis should be clearly presented: equimolecular ammounts of aryl aldehydes and 4-ethylaniline (this means the same number of moles, but how many moles???). The method should be clear. PLEASE complete.
3. TLC and Column chromatography: what solvents do you use for elution??
4. HNMR: be more specific: **Two multiplet's position at around d 6.41-6.87 and d 7.06-7.14 for two phenyl groups**
5. References are too old and Ref 17 is not properly written.

So, in order to be accepted, the paper needs carefully revision. **This is my editorial decision: major revision.**
