

SDI FINAL EVALUATION FORM 1.1

PART 1:

Journal Name:	Asian Journal of Pregnancy and Childbirth
Manuscript Number:	Ms_AJPCB_44542
Title of the Manuscript:	A Cross-Sectional Study on the Factors Leading to Unintended Pregnancy in Women Attending Selected Health Facilities in Kumasi, Ghana
Type of Article:	Original Research Article

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	Authors' response to final evaluator's comments
I have made comments in the body of the paper, but there still need to be changes made Mainly, there needs to be information about from where these participants were recruited. What were the inclusion criteria? What population do these women represent? Also, there is more information needed about the statistical methods employed. While the paper asserts statistical relationships, the authors never state which methods they used. There are quite a few references missing from the background section.	Information about where the participants were recruited have been added in the abstract section and the methodology. The inclusion criteria have been added to the methodology. The women were sampled from the health facilities (MCHH and MSIG). This has been captured in the methodology section of the paper. Bivariate analysis is the simultaneous analysis of two variables (attributes). It explores the concept of relationship between two variables, whether there exists an association and the strength of this association, or whether there are differences between two variables and the significance of these differences. Issues with references have been resolved in the document.
