

Editor's Comment:

I have gone through the manuscript. But i am very much not impressed by case presentation and discussion.

How did it was diagnosed as Stevens Johnson syndrome? What was the body surface area involvement? Erythema multiforme follows herpes infection not even Steven johnson syndrome. How Herpes infection was diagnosed? Did they do HSV igG igM antibodies. No references with reference to Lymphocytic vasculitis and Steven Johnson syndrome.
This would be not appropriate for publishing. It's a no for me.
