

SDI FINAL EVALUATION FORM 1.1

PART 1:

Journal Name:	British Journal of Applied Science & Technology
Manuscript Number:	Ms_BJAST_23670
Title of the Manuscript:	Mycoflora and Moisture Content of Garri Sold in Anyigba, Kogi State
Type of Article:	Original Research Articles

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	Authors' response to final evaluator's comments
Unacceptable response on the part of the author(s). No changes were made, despite the problems with statistics in the manuscript. 'Random sampling' is not a technique. There are many things similar, like 'stratified random sampling', 'simple random sampling', etc., so perhaps the authors should consider elaborating on their statistical model. How were the data analyzed? ANOVA? ANCOVA? Some type of regression? How did they find where the difference lay? No tests are mentioned. No standard deviation is given, no P values. No conclusions can be drawn without statistical analysis, as this is the backbone of scientific research. Microbiologist or not, you still have to use statistics.
