

Editor's comment:

1. The title should reflect what the paper discusses which is comparing profitability of enterprises and the variables that enhance profit. I am not comfortable with the use of "conditions and tendencies of forming".
2. The introduction conceals information on Ukraine agriculture, and the concepts of profitability formation [if any].
3. The specific objectives, conceptual issues and the methodology are not specified.
4. the analyses uses serial data of 2009 - 2013. Only five years data is too small for application of the regression analytical technique.

Author's feedback:

We are grateful to the editor for his attention to our material. We agreed with editor, corrected the manuscript and highlighted that part in the manuscript.

1. The title of the research was changed according to your recommendations.
2. We added to the introduction information about Ukraine agriculture.
3. We specified the specific objectives, the conceptual issues and the methodology of our research.
4. The regression analytical technique in our research is based on data from 63 typical agriculture enterprises of Lviv region for 2013 (Table 3. «Initial figures for building multivariate regression models concerning the profitability of Lviv region farms in 2013»). Information of so many companies provides the opportunity for successful use in research the regression analytical technique.
The research results, which obtained by using the regression analytical technique is fully representative.
