

Editor's comments:

The submitted manuscript reports an interesting and well-documented study. From an editorial point of view a differential diagnosis should be added to the discussion. In the legend to the figure 1B should be mass lesion showing intense contrast enhancement.

Authors' feedback:

Thank you very much for your positive feedback. We added differential diagnosis as "
differential diagnosis, causes of the mass to be considered should include bronchial cysts, saliva gland
tumours, carotid artery aneurism, lateral aberrant thyroid gland, malignant lymphoma, neurofibroma,
tuberculous lymphadenitis and metastatic carcinoma"
Legend corrected.
