

SDI FINAL EVALUATION FORM 1.1

PART 1:

Journal Name:	British Microbiology Research Journal
Manuscript Number:	Ms_BMRJ_25845
Title of the Manuscript:	Association of Hepatitis Virus Infections with CD4 and CD8 Among Certain Group of Lymphoma Patients in Babylon Provence
Type of Article:	Original Research Article

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	Authors' response to final evaluator's comments
I'm expecting that authors already address my initial comments in the modified draft. However, I haven't seen those answers and changes yet. 1) How did the authors distinguish the impact of hepatitis viral infection to the tumor expansion on the tissue infiltration of CD4 and CD8 T cells? 2) Why did the authors suddenly measure levels of autoantibodies in these patients ? Please incorporate the background rationale to justify the measurement of these autoantibodies. Also, why did the authors not incorporate these findings in their conclusion? 3) In each figure & table, please show the absolute count beside the percentage. 4) Did the authors find any patient with co-infection between HBV and HCV ? 5) Pertaining to the CD4 and CD8 staining, the authors should show the negative control result (healthy tissue) as well.	We have corrected the most important notes. All the studied patients have tumor , some of them have hepatitis infection and statistically mentioned as high percentage of patients have HCV infection. We added at line 18 in manuscript. Some of these figures need to give the absolute count and percentage, such as table of CD4 , CD8 and autoantibody . The HCV infections more distributed rather than other HBV and HAV as well as no co- infections were recording at the study time. (recorded at line 162 and 163) Negative staining was added .
