

SDI FINAL EVALUATION FORM 1.1

PART 1:

Journal Name:	Current Journal of Applied Science and Technology
Manuscript Number:	Ms_CJAST_38218
Title of the Manuscript:	Colony Collapse Disorder of honey bee: A neoteric ruction in global apiculture
Type of the Article	Review Paper

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	Authors' response to final evaluator's comments
Currently there is no problem of CCD world over, and the disease has completely disappeared. Viewing the policy of the journal and an incentive to the authors I would recommend its publication. Authors have modified the objectionable contents. However, the article needs to be read by a language expert to rectify its linguistic errors that can be done at the editorial level or may be referred back to the authors for necessary action. For that matter, I would recommend a minor revision.	CCD is not a specific disease, but, a disorder of honey bee. The term came in the form of a serious issue after sudden havoc colony losses from American sub-continental countries followed by spread many other countries of Asia and Europe by lacking of the exact reason/reasons. Hence, there are different opinions of researchers from number of corners of the world regarding the causes of CCD. The intensity of problem may however is less presently, but, the probable causes those have been suspected and identified in various research with suitable justifications are still the burning research topics in the field of life science till date. Suitable references are also added in the manuscript in which advanced researches on CCD, its cause, parasites, molecular identification etc. have been done globally in the year 2017. Here, the present authors have gathered the findings, views, reasons, issues, situations, discussions and distinguish controversial points about CCD in a single article came from different parts of the world. Moreover, the linguistic errors have already been modified by the senior author, according to the reviewers' comments.
