

Editorial Comments:

Further following data has not been delivered:

1. The authors should give all the materials used in more detail (chemicals and cultivars used with information on how or from where they acquired these and in what quality).
2. Please give some information on callusing in the introduction, why is it necessary and what potentials does it bring. Please also explain the terms callus induction, proliferation and caulogenesis shortly in this context. Finally, the authors should give some background in the introduction on the known effects of media and growth regulators on the process - which types are preferred - pros and contras.

I expect that the authors consider these remarks.

Author's Feedback:

1. Chemicals used in this research are well defined under the heading culture media (preparation of stock, stock solution of growth regulators, media) along with list of chemicals in table 1. Two cultivars scania and indios are used in this research figures of which are given as "a and b". chemicals has been acquired from (Hi-Media Laboratories Pvt. Ltd) given in the manuscript.
2. Information on callusssing in introduction incorporated. Regarding caulogenesis there is no term in manuscript. Background also incorporated.
3. Incorporations required according to comments have been done. Hopefully you consider the incorporations.
