

Editor's Comments and Authors' Feedback

The manuscript entitled "Factors Associated with Early and Late Initiation of ART in HIV Infected Pregnant Women in the South West Region, Cameroon" is very interesting study and brings important approaches to the South west region.

I suggest to authors to change the word "factors associated" to associated factors..... on the title.

(changed as suggested)

- The manuscript is well written , the statistical analysis sounds good. I strongly suggest that a native english speaker revise all the manuscript, there are many spelling and grammar mistakes

(grammar edited using a soft ware)

I suggest to authors to change the **key words** on line #27 to:

Key words: HIV, Antiretroviral Therapy, Cameroon, Pediatric, Pregnant women

(thanks-modified)

on table 1- I did not understand why the authors include together the terms: Catholics/Protestants

Pentecostal is the same as protestant? I think yes.

(We combined Catholics and protestants because Catholics and protestants are the mainstream churches and they own most of the faith-based hospitals and promote hospital-based care while the Pentecostals generally are more recent are mostly those who believe in faith healing of diseases. The protestants here include Baptist and Presbyterians).

The authors should add others choices such as: another other religion or nor religion

Conclusion section:

on line 275 , there is double in , please delete one :

"These factors identified will be important in in "

(Edited)

I strongly suggest to authors to at least , avoid abbreviations on the abstract and on the conclusions section, since it makes difficult to understand .

(Thanks-Edited)

Finally ,

I really congratulate the authors for the very interesting study, a careful english revision should be done on the manuscript.

(Thanks for the compliment)
