

**Editor's comments:**

The author did not correct the manuscript as stipulated in the journal format.

There are mistakes especially in the references part.

The sex ratio is high (462-males and 28-female) Which sampling technique was used?- line 65

Statistical Analysis should be described- line 85-88

I agree with the second reviewer's evaluation.

**Author's feedback:**

**I have corrected the reference in the body of the manuscript by putting them in square brackets and highlighted the corrections in the reference section with yellow.**

**The reason for the high sex ratio has been rationalize by the opening sentence under the discussion line 120-123 and 228-239. Consecutive sampling technique was used and it is highlighted with yellow in line 65.**

**Statistical analysis is highlighted in lines 85-88 with yellow.**
