

Editor's Comment:

I generally agree with both reviewers' comments and the author's revisions. However, the authors have to make a minor revision before final acceptance.

(1) One reference is missed. The N derived from the atmosphere by the plant with and without the introduced rhizobia on the field was between 51-56 % which was within the range reported for other legumes ().

(2) Figures 1 and 2 should mark the significant differences on the bars

(3) Tables. all p values should give the value like (0.01) not (.01).
