

Journal Name:	International Journal of Research and Reports in Hematology
Manuscript Number:	Ms_IJR2H_42664
Title of the Manuscript:	Correlation of Haematological Parameters with TNF-α and Interleukin (IL-6) in Seropositive HIV Patients on Highly Active Antiretroviral Therapy (HAART) and HAART Naïve patients.
Type of the Article	Original Research Article

General guideline for Peer Review process:

This journal's peer review policy states that **NO** manuscript should be rejected only on the basis of '**lack of Novelty**', provided the manuscript is scientifically robust and technically sound. To know the complete guideline for Peer Review process, reviewers are requested to visit this link:

PART 1: Review Comments

		Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments	Hematologic indices are shown as reliable clinical indices in HIV-infected patients, regardless of whether these patients are receiving HAART treatment or not. Cytokines TNF-alpha and IL-6 levels correlate negatively with such parameters and also provide means for directing therapy against HIV replication. This study is well-conducted and clinically relevant to management of a majority of HIV-infected patients.	Hence it is very important to know the implication of HAART and cytokines on these clinical indices.
Minor REVISION comments		
Optional/General comments	The elevated cytokine levels noted in this study are relevant to further understanding of the pathogenic roles of the inflammatory response in HIV infection and reflect host responses in further progression to the AIDS stage of infection.	This vindicates the importance of this research
