

Editorial Comments:

I have carefully reviewed the paper: Assessment of Platelet aggregation, and Fibrinolytic Activity in Egyptian Patients with decompensated Liver Cirrhosis

Running title: fibrinolytic activity and liver cirrhosis

I have also reviewed the comments of the previous reviewers, and noted that the authors have made the changes requested by the first reviewers, so the paper complies with the changes requested.

However, in reviewing the document completely, I noticed that in the section on statistical analysis the authors only mention the Software used to perform their analysis, but they do not mention what statistics were applied and what variables they analyzed so that the reader could understand their manuscript.

On the other hand, the sample size of only 30 subjects per group does not allow us to make conclusions as to whether this was a study comparing 3 cohorts, so I think that only the description of the group of individuals affected by cirrhosis can be made.

Author Feedback:

Thanks Sir for your valuable comments

The two remarks were considered in the revised 2 manuscript. My response to editor remarks were highlighted Green

Methods of statistics was added and a table of comparison between all the cirrhotic patients (90 patients) and control group was considered in the results (table 5)
