SDI Review Form 1.6

PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
<u>Compulsory</u> REVISION comments	- Explain what was the method of collection of tap water, because contamination can occur in collecting. - The number of samples can not prove that the bottled water is safe for human consumption. You can say only that the samples are analyzed in accordance with the parameters of the laws used in this study. - There are many published studies on the subject that should be used to study not only the cases of Tanzania. The bibliographic references are lower than the study requires. - If it is an independent study, without corporate sponsorship, I believe that the names of manufacturers and brands should not be displayed, because it may induce the reader to consume them. - The main objective of the study should be alert to the need and the human right to safe tap water and the consumer's decision by bottled water except for water security in relation to human health.
