

Editor's Comment:

This is an Interesting study: I have the following comments.

1. Accept the ms after including the following minor editing corrections that I have underlined for correcting grammatical errors.

A. abstract- background: ".....have been documented yet."

B. Discussion- "While HIV infection and AIDS development have been promoted in those countries, effective countermeasures for them are needed. Of course, it is important to keep in mind that other symptoms such as fever, diarrhea or vomiting caused by HIV infection could breakout even in a widow period.

Limitations of this study are a lack of information about daily meal portion and exercise amount. Since these factors could greatly impact BMI, we cannot state that low BMI of HIV-positive individuals is caused by HIV infection or others such as daily meal portion and exercise amount [11]. Also nutrients needed to be pursued. Actually, we collected their meal items then, executed a nutrients classification. However, they are degenerating by cooking method and seasoning. Thus, more detailed field verification should have been implemented. In addition, we needed to get more details of medication history to consider about the effects by ART. Because representative side effects of ART, especially nausea, diarrhea may have great effect on their eating habits [12]."

C. Please include correct spellings of "CONSENT" and "CONCLUSION" in headings of these sections.

With these corrections, accept the manuscript.
