SDI Review Form 1.6

PART 1: Review Comments

	Reviewer's comment Nocardiosis is a rare infection, with few cases published in the medical literature, despite the increasing number of immunocompromised individuals. The publication of these three cases of pulmonary and systemic Nocardiosis is praiseworthy in order to draw our attention to the differential diagnosis of pulmonary diseases that occur with nodules with or without cavities associated with pulmonary infiltrates. Therefore, a commentary on the differential diagnosis of pulmonary lesions and CNS lesions would be lacking in their discussion.	Author's comment <i>(if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)</i>
<u>Compulsory</u> REVISION comments	1-Every time it appears in the text Nocardiosis species, the correct would be Nocardiosis spp 2- In the text, there are many words attached to others. Please correct 3 - In the text there are words beginning with a capital letter, such as Prothrombin and Intravenous, which you must correct in lowercase.	Corrected Nocardiosis species to spp, Highlighted in yellow Spacing done, Highlighted in yellow Corrected in lower case, Highlighted in yellow
<u>Minor</u> REVISION comments		
<u>Optional/General</u> comments	As I said, this case report has value due to the scarcity of publication in the medical literature and to draw the attention of physicians that Nocardiosis should always enter into the differential diagnosis of pulmonary infiltrates in immunocompromised patients	Included in lines 151-154 and reference no.8 Highlighted in yellow
