PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments	In abstract results its mentioned about Lactophenol cotton blue agar but in the manuscript there is no mention about LCB instead its written as Sabouraud's Dextrose agar. 7011 cases? All those case were examined for presence of tinea capitis? Such huge number is not justified You want to compare clinical type with that of KOH and culture? Its written as 60 cases were confirmed to have tinea capitis by culture and KOH but only 35 out of 60 are positivite for culture. There is lot of confusion regarding the numbers and percentage please correct it	Abstract is corrected and lactophenol cotton blue staining for microscopic staining is now mentioned in methodology. The patients were either KOH positive or culture positive (Showed growth of dermatophyte) with clinical picture of tinea capitis (non-inflammatory or inflammatory type. And patients were followed during treatment period and all patients did well under systemic treatment with Griseofulvin or Terbinafine, and were healed completely. This all considered in diagnosis. Numbers and percentage were revised and corrected.
Minor REVISION comments		
Optional/General comments
