

Reviewer's Comment:

I had read the manuscript again and the feedback,

Authors did not improved Discussion: I strongly suggest separating this from the results, otherwise, by reading, there is a repetition of the results again and there is a lack of real discussion based on references of previous works and the present situation of the local health policies.

Moreover, they do not respect the format of the tables and the number of maps are really unnecessary.

There are some comments at the conclusion like:

Statistically there is no relationship between per capita income (PCI) and the diseases burden and the same with calorie intake in relation to disease burden. Lack of proper sanitation, lack of pure drinking water, lack of health facilities low literacy rate and lack of awareness are the main factors for the diseases burden in the study area.

In the full manuscript, there is no evidence of such a statistical analysis.
There are other minor comments also, but the above mentioned are the most striking.

I won't accept such a work for publication.
