PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments	The prospective review article is well written. The etiology of the pelvic fractures are comparable to that found in orthopedics literature. Because of economic constraints, plain X-rays were done to diagnose the fractures. However, there was no mention of the treatment options undertaken and outcome of these patients. Were any CT scans done at all? Sometimes CT scans can delineate fractures better, especially in cases of acetabular fractures, as also for operative planning. It will be interesting to know how many patients received surgical interventions. Also, the treatment options for the group of patients who presented later. How did those patients fare? Were there any significant differences in outcomes between the patients who sought immediate medical attention vs those who presented week to month later. There were some spelling errors. "Haematuria"	
Minor REVISION comments		
Optional/General comments
