Abstract

A non-overlapping domain decomposition method (DDM) is described to solve optimal boundary control problems governed by wave equations with absorbing boundary condition. The whole domain is divided into non-overlapping subdomains, and the global optimal boundary control problem is decomposed into local problems in these subdomains. An integral mean method is utilized to present an explicit flux calculation on the inter-domain boundary in order to communicate the local problems on the interfaces between subdomains. We establish the full parallel and discrete schemes for solving these local problems, and prove the stability of the schemes. A priori error estimates in suitable natural norms are derived for the state, co-state and control variables.

Keywords: Wave equations; Optimal absorbing boundary control problems; Non-overlapping DDM; Integral mean method; Error estimates

2010 Mathematics Subject Classification: 65N12; 65N15; 65N22

1 Introduction

Optimal control problems governed by wave equations are widely used in many fields, such as in medical science [Clason et al. (2009)], seismic wave [Komatitsch and Tromp (1999)] and acoustic wave [Banks et al. (1988)]. Generally speaking, these optimal control problems aim to find a control variable which makes the state variable tend to an expected target state in the process of optimizing (maximize/minimize) the objective functional and meanwhile, the state and control variables are subjected to wave equations. [Kröner et al. (2011)] and [Gugat and Keimer (2009)] considered some numerical methods for optimal control problems governed by wave equations.

As well known, for the problem on large domain, the traditional numerical methods, such as finite element methods, always produce large amounts of calculation which can be settled efficiently by

*Corresponding author: E-mail: makeying@sdu.edu.cn

the method of parallel computations. A natural way in parallel computations is the non-overlapping domain decomposition method (DDM). [Lions et al. (1973); Leugering (1999, 2000); Benamou (1996); Hou and Lee (2011); Benamou (1999)] discussed the applications of non-overlapping DDM for optimal boundary control problems governed by partial differential equations (PDEs). This method can divide the whole domain into many subdomains, and decompose the global problem into many local problems, which are independent in the subdomains and can be calculated parallel. Hence, this method can reduce much amounts of calculation. An important character of this method is how to build inter-domain boundary conditions of state/co-state variables between subdomains. For an example, for optimal boundary control problems governed by hyperbolic equations, [Benamou (1999)] presented an iterative non-overlapping DDM, utilized Robin condition as the inter-domain boundary condition and proved the convergence of the method.

When calculating solutions to the problem in an unbounded domain, it is often essential to introduce artificial boundaries to limit the area of computation. Important fields of applying artificial boundaries are local weather prediction [Roache (1972); Elvius and Sundstrom (1973)], geophysical calculation involving acoustic waves [Boore (1972)] or elastic waves [Kelly et al. (1974)]. For wave equations, Engquist et al. [Engquist and Majda (1997)] developed the theory of absorbing boundary condition, which is a kind of artificial boundaries and consists of the time and space derivatives of the function. This boundary condition not only guarantees stable difference approximations but also minimizes the (unphysical) artificial reflections which occur at the boundaries. Cowsar, Dupont and Wheeler [Cowsar et al. (1996)] proposed the mixed finite element method for linear hyperbolic equation with absorbing boundary condition. In [Bamberger et al. (1997)], Bamberger et al. discussed a DDM for the acoustic wave equation with absorbing boundary condition.

Lagnese et al. [Lagnese and Leugering (1997)] studied a time-domain decomposition method for an optimal boundary control problem governed by wave equations with absorbing boundary condition. The objective functional consisted of the final time values of both the function and the time derivation of the function. They decomposed the global optimal control problem into local problems on each time interval, built inter-domain boundary conditions for state/co-state variables between subdomains, and proved the convergence of the method.

The purpose of this paper is to present another type of non-overlapping DDM for the model problem in [Lagnese and Leugering (1997)]. Based on our former work [Ma et al. (2009)] and different from the methods in [Lions et al. (1973); Leugering (1999, 2000); Benamou (1996); Hou and Lee (2011); Benamou (1999)], we utilize an integral mean method to present an explicit flux calculation on the inter-domain boundary and establish the non-overlapping domain decomposition scheme. This type of non-overlapping DDM has been presented for parabolic equation in [Ma et al. (2009); Ma and Sun (2010); Sun and Ma (2011, 2014)], wave equation [Sun and Ma (2010)] and convection-diffusion equation [Ma and Sun (2011)]. Nevertheless, we did not extend this method to optimal boundary control problems governed by wave equations, especially with absorbing boundary condition. This paper is one of our sequent research papers. To our best knowledge, there is no similar work on this topic.

An outline of this paper is as follows. In §2, we introduce the optimal boundary control problem governed by wave equations with absorbing boundary condition, and deduce the co-state equation and the optimality condition. In §3, we recall the non-overlapping DDM by using the integral mean method in [Ma et al. (2009)]. Then, we utilize this method to establish the full discrete schemes, and prove the stability of the schemes. In §4, we derive a priori error estimates in suitable natural norms for the state, co-state and control variables. Finally, we draw the conclusions in §5.

2 Optimal boundary control problem

Let $\Omega \subset \mathbb{R}^2$ be a bounded convex domain with smooth boundary $\partial\Omega$ and $[0, T]$ be a time interval. Let $\partial\Omega = \Gamma_N \cup \Gamma_D$, $\Gamma_N \cap \Gamma_D = \emptyset$, Γ_N and Γ_D be Neumann and Dirichlet type boundary, respectively.

Throughout the paper, the standard notations [Adams (1975)] are used for the Lebesgue space $L^m(\Omega)$, $1 \leq m \leq \infty$ and the Sobolev space $H^s(\Omega)$, $0 \leq s \leq \infty$ with the associated norms $\|\cdot\|_s$ and seminorms $|\cdot|_s$. We will assume C to be a generic positive constant independent of mesh size h (to be defined in the next section), but may depend on the size of Ω and can take different values at different places.

Denote the state space by $W = L^2(0, T; V)$ with $V = H^1(\Omega)$ and the control space by $X = L^2(0, T; M)$ with $M \subseteq L^2(\Gamma_N)$. We consider the following optimal boundary control problem governed by wave equations with absorbing boundary condition [Lagnese and Leugering (1997)]:

$$\min_{u \in X} J(u) = \min_{u \in X} \left\{ \frac{\gamma}{2} \left\{ \int_{\Omega} |y(T) - z_0|^2 + \int_{\Omega} \left| \frac{\partial y}{\partial t}(T) - z_1 \right|^2 \right\} + \frac{\alpha}{2} \int_{\Gamma_N \times (0, T)} |u|^2 \right\} \quad (2.1)$$

where, the state variable $y \in W$ and control variable $u \in X$ satisfy

$$\begin{cases} \frac{\partial^2 y(x, t)}{\partial t^2} - \Delta y(x, t) + cy = f(x, t), & \text{in } \Omega \times (0, T), \\ \frac{\partial y(x, t)}{\partial \vec{\nu}} + \frac{\partial y}{\partial t} = u(x, t), & \text{on } \Gamma_N \times (0, T), \\ y(x, t) = 0, & \text{on } \Gamma_D \times (0, T), \\ y(x, 0) = y_1(x), & \text{in } \Omega, \\ \frac{\partial y}{\partial t}(x, 0) = y_2(x), & \text{in } \Omega. \end{cases} \quad (2.2)$$

In equations (2.1)-(2.2), $\vec{\nu}$ is the unit outward normal vector on Γ_N , $f(x, t)$, $y_1(x)$ and $y_2(x)$ are known functions, $z_0(x)$, $z_1(x)$ are known target functions, γ and α are positive given weight coefficients. The boundary condition on Γ_N is called as absorbing boundary condition, which includes the time and space derivatives of the state y . Here, we consider the objective functional $J(u)$ with final time values of both y and $\partial y / \partial t$. The overall idea of equation (2.1) is to drive y and $\partial y / \partial t$ as close as possible to the target state $z_0(x)$ and $z_1(x)$ respectively, while the second term penalizes excessive control cost.

According to the optimal control theory in [Lions (1971); Neittaanmäki and Tiba (1994); Liu and Yan (2008)] and [Lagnese and Leugering (1997)], we can obtain the adjoint equation of

$$\begin{cases} \frac{\partial^2 p(x, t)}{\partial t^2} - \Delta p(x, t) + cp = 0, & \text{in } \Omega \times (0, T), \\ \frac{\partial p(x, t)}{\partial \vec{\nu}} - d_t p = 0, & \text{on } \Gamma_N \times (0, T), \\ p(x, t) = 0, & \text{on } \Gamma_D \times (0, T), \\ p(x, T) = \gamma \left(\frac{\partial y}{\partial t}(T) - z_1 \right), & \text{in } \Omega, \\ \frac{\partial p}{\partial t}(x, T) = -\gamma(y(T) - z_0), & \text{in } \Omega. \end{cases} \quad (2.3)$$

where, $p \in W$ is called the co-state variable of y . And, $d_t : L^2(0, T; M) \mapsto (H^1(0, T; M))^*$ is a bounded linear operator satisfying [Lagnese and Leugering (1997)]

$$\langle d_t p, \phi \rangle_{\Gamma_N \times (0, T)} := - \int_0^T \left(p, \frac{d\phi}{dt} \right)_M dt, \quad \forall \phi \in H^1(0, T; M).$$

where, space $(H^1(0, T; M))^*$ is the dual space of space $H^1(0, T; M)$, $\langle \cdot, \cdot \rangle_{\Gamma_N \times (0, T)}$ denotes the inner product in the $(H^1(0, T; M))^*, H^1(0, T; M)$ duality pairing. We note that $d_t p$ is not the time derivative dp/dt of p in the sense of distributions.

We know that when the objective functional J reaches its optimum, the control variable $u \in X$ should satisfy ([Lions (1971); Neittaanmäki and Tiba (1994); Liu and Yan (2008)])

$$J'(u)(\tilde{u} - u) = \int_{\Gamma_N \times (0, T)} (\alpha u + p|_{\Gamma_N})(\tilde{u} - u) \geq 0, \quad \forall \tilde{u} \in X. \quad (2.4)$$

 Figure 1: Subdomains Ω_i and inter-domain boundary Γ .

This inequality is called as the optimality condition.

Then, the optimal boundary control problem (2.1)-(2.2) is equivalent to an optimality system, which consists of the state equation (2.2), the co-state equation (2.3) and the optimality condition (2.4). We can get the solutions of equations (2.1)-(2.2) by solving the optimality system (2.2)-(2.4).

3 Non-overlapping DDM

3.1 Approximation schemes

To avoid large amounts of computational work by the traditional numerical methods to the optimality system (2.2)-(2.4), we will build a non-overlapping domain decomposition scheme.

For simplicity and without losing generality, we only discuss the case of two subdomains. But the algorithms and theories can be extended to the case of many subdomains. Divide Ω into two non-overlapping subdomains $\Omega_i (i = 1, 2)$ by an inter-domain boundary Γ (see Figure 1)

$$\Omega = \Omega_1 \cup \Omega_2, \quad \Omega_1 \cap \Omega_2 = \Gamma.$$

Let $\Gamma_{D,i} = \Gamma_D \cap \partial\Omega_i$ and $\Gamma_{N,i} = \Gamma_N \cap \partial\Omega_i$, $\Gamma_{D,i} \neq \emptyset$, $\Gamma_{N,i} \neq \emptyset$. Define $\vec{\nu}_\Gamma$ to be the unit normal vector on Γ , which points from Ω_1 toward Ω_2 . We suppose that this decomposition guarantee the global and local problems hold enough regularities.

Let T_i^h be a quasi-uniform partition of subdomains $\Omega_i (i = 1, 2)$ and $T^h = T_1^h \cup T_2^h$. Define $\bar{\Omega} = \cup_{\tau \in T^h} \bar{\tau}$. Here, h denotes the maximal diameter of element $\tau \in T^h$. For two neighboring elements $\tau, \bar{\tau} \in T^h$, they have either only one common vertex or edge. Let $V^h \subset V$ is a finite element space satisfying

$$V^h = \{v \in H^1(\Omega) : v|_\tau \in \mathcal{P}_1(\tau), \forall \tau \in T^h\},$$

where $\mathcal{P}_1(\tau)$ denotes the polynomials of degree less than or equal to 1 on τ . Denote $W^h = L^2(0, T; V^h)$

Similarly, let $T_{U,i}^h$ be a quasi-uniform partition of $\Gamma_{N,i}$ and $T_U^h = T_{U,1}^h \cup T_{U,2}^h$. Let h_U denote the maximal diameter of element $\tau_U \in T_U^h$. For two neighboring elements $\tau_U, \tau'_U \in T_U^h$, they have only one common vertex. Let $M^h \subset M$ is a finite element space satisfying

$$M^h = \{v \in L^2(\Gamma_N) : v|_{\tau_U} \in \mathcal{P}_0(\tau_U), \forall \tau_U \in T_U^h\}.$$

where $\mathcal{P}_0(\tau_U)$ denotes the polynomials of degree 0 (i.e., constant) on τ_U . Denote $X^h = L^2(0, T; M^h)$.

From definitions above, we note that functions v in W^h have a well-defined jump $[v]$ on Γ :

$$[v](x) = \lim_{\lambda \rightarrow 0^+} v(x + \lambda \vec{\nu}_\Gamma) - \lim_{\lambda \rightarrow 0^-} v(x + \lambda \vec{\nu}_\Gamma). \quad (3.1)$$

 Figure 2: The strip domain G with width $2H$.

To construct the scheme, for a small given constant $0 < H < \min\{\text{diameter}(\Omega_1), \text{diameter}(\Omega_2)\}$, we introduce an integral mean value of a given function $v \in H^1(\Omega)$ on Γ as (Ma et al. (2009))

$$\bar{v}_H = \frac{1}{2H} \int_{-H}^H v(x + \lambda \vec{\nu}_\Gamma) d\lambda, \quad \forall x \text{ on } \Gamma. \quad (3.2)$$

Generally, near the intersection of the boundary $\partial\Omega$ and inner boundary Γ , the value of v outside Ω may be needed to calculate the integral mean value $\bar{v}_H$ in (3.2). For a given function $v \in L^2(\Omega)$, we define ([Ma et al. (2009)])

$$Ev(x) = \begin{cases} v(x), & x \in \Omega, \\ v(\tilde{x}), & x \notin \Omega, \end{cases} \quad (3.3)$$

where $\tilde{x} \in \Omega$ denotes the symmetric point of $x \notin \Omega$ with respect to $\partial\Omega$. By (3.3), we know $\bar{v}_H$ has the value on a strip domain $G = \{y | y = x + \lambda \vec{\nu}_\Gamma, \lambda \in [-H, H], x \text{ on } \Gamma\}$, see Figure 2.

Let Δt be time step size, $N = T/\Delta t$, $t^n = n\Delta t$, $n = 1, \dots, N$. For a given function v , we adopt the following notations. Set

$$\begin{aligned} v^n &= v(t^n), & v^{n+\frac{1}{2}} &= \frac{v^{n+1} + v^n}{2}, \\ v^{n,\theta} &= \theta v^{n+1} + (1-2\theta)v^n + \theta v^{n-1}, \quad \theta \in (0, 1), \\ \partial_t v^n &= \frac{v^{n+1} - v^n}{\Delta t}, & \partial_t v^{n-1} &= \frac{v^n - v^{n-1}}{\Delta t}, \\ \delta v^n &= \frac{v^{n+1} - v^{n-1}}{2\Delta t}, & \partial_t^2 v^n &= \frac{v^{n+1} - 2v^n + v^{n-1}}{(\Delta t)^2}. \end{aligned} \quad (3.4)$$

By using of the integral mean non-overlapping DDM scheme in [Ma et al. (2009)], we can define the full discrete schemes for the optimality system (2.2)-(2.4): Find the approximation solution $\{Y^n, U^n\}_{n=1}^N \in V^h \times M^h$ satisfying

$$\begin{aligned} J(U) &= \sum_{n=1}^{N-1} \frac{\alpha}{2} \int_{\Gamma_N} |U^{n,\frac{1}{4}}|^2 \Delta t + \frac{\gamma}{2} \left\{ \int_{\Omega} |Y^N - z_0|^2 + \int_{\Omega} |\partial_t Y^{N-1} - z_1|^2 \right\} \\ &\quad - \frac{\gamma}{4} (\Delta t)^2 \left\{ \langle [\partial_t Y^{N-1} - z_1], (\overline{\partial_t Y^{N-1} - z_1})_{\vec{\nu}_{\Gamma,H}} \rangle_{\Gamma} + \langle [Y^N - z_0], (\overline{Y^N - z_0})_{\vec{\nu}_{\Gamma,H}} \rangle_{\Gamma} \right. \\ &\quad \left. + \frac{KH^{-1}}{2} \{ \langle [Y^N - z_0], [Y^N - z_0] \rangle_{\Gamma} + \langle [\partial_t Y^{N-1} - z_1], [\partial_t Y^{N-1} - z_1] \rangle_{\Gamma} \} \right\}, \end{aligned} \quad (3.5)$$

and

$$\begin{cases} (\partial_t^2 Y^n, v) + (\nabla Y^{n, \frac{1}{4}}, \nabla v) + c(Y^{n, \frac{1}{4}}, v) + \langle \overline{Y_{\Gamma, H}^n}, [v] \rangle_{\Gamma} \\ \quad + \langle \overline{v_{\Gamma, H}}, [Y^n] \rangle_{\Gamma} + KH^{-1} \langle [Y^n], [v] \rangle_{\Gamma} \\ = (f^{n, \frac{1}{4}}, v) + \langle U^{n, \frac{1}{4}}, v \rangle_{\Gamma_N} - \langle \delta Y^n, v \rangle_{\Gamma_N}, & \text{in } \Omega, \\ Y^0 = y_1(x), & \text{in } \Omega, \\ \partial_t Y^0 = y_2(x), & \text{in } \Omega, \end{cases} \quad (3.6)$$

where $\forall v \in V_0^h = \{v \in V^h, v|_{\Gamma_D} = 0\}$;

$$\chi_{\Gamma}^n = (\nabla E \chi^n) \cdot \vec{\nu}_{\Gamma}, \quad \text{for } \chi = Y, v; \quad K = \begin{cases} 1, & \text{if } G \subset \Omega, \\ 2, & \text{if } G \not\subset \Omega. \end{cases}$$

The notation $\langle \cdot, \cdot \rangle_{\Gamma}$ (resp. $\langle \cdot, \cdot \rangle_{\Gamma_N}$) is denoted as the L^2 inner product on the boundary Γ (resp. Γ_N). On Γ_N , δY^n is used to approximate $\partial y / \partial t$ in order to keep second order convergence rate for Δt .

Remark 3.1. In the scheme (3.6), the flux on Γ is computed explicitly from Y^n , so that Y^{n+1} can be computed on Ω_1 and Ω_2 fully parallel once Y^n , Y^{n-1} have been got. From the convergence analysis in Section 4, we will see that this scheme has good approximations.

From the optimal control theory in [Lions (1971); Neittaanmäki and Tiba (1994); Liu and Yan (2008)], we can deduce the full discrete schemes for the adjoint equation (2.3): Find $P^n \in V^h$ satisfying

$$\begin{cases} (\partial_t^2 P^n, w) + (\nabla P^{n, \frac{1}{4}}, \nabla w) + c(P^{n, \frac{1}{4}}, w) + \langle \overline{P_{\Gamma, H}^n}, [w] \rangle_{\Gamma} \\ \quad + \langle \overline{w_{\Gamma, H}}, [P^n] \rangle_{\Gamma} + KH^{-1} \langle [P^n], [w] \rangle_{\Gamma} = \langle \delta P^n, w \rangle_{\Gamma_N}, & \text{in } \Omega, \\ P^N = \gamma(\partial_t Y^{N-1} - z_1), & \text{in } \Omega, \\ \partial_t P^{N-1} = -\gamma(Y^N - z_0), & \text{in } \Omega, \end{cases} \quad (3.7)$$

for $\forall w \in V_0^h$ and for the optimality condition

$$\langle \alpha U^{n, \frac{1}{4}} + P^{n, \frac{1}{4}}, \tilde{u} - U^{n, \frac{1}{4}} \rangle_{\Gamma_N} \geq 0, \quad \forall \tilde{u} \in M^h. \quad (3.8)$$

Hence, we establish the full discrete schemes (3.6)-(3.8) for the optimality system (2.2)-(2.4).

3.2 Stability of approximation schemes

To prove the stability of the full discrete schemes (3.6)-(3.8), we need the following notations and lemmas. For functions $\psi \in H^1(\Omega_1) \cup H^1(\Omega_2)$, we define [Ma et al. (2009)]

$$|||\psi|||^2 = (\nabla \psi, \nabla \psi) + KH^{-1} \langle [\psi], [\psi] \rangle_{\Gamma}, \quad (3.9)$$

and a bilinear form

$$b(\psi, \psi) = (\nabla \psi, \nabla \psi) + 2 \langle \overline{\psi_{\Gamma, H}}, [\psi] \rangle_{\Gamma} + KH^{-1} \langle [\psi], [\psi] \rangle_{\Gamma}. \quad (3.10)$$

Lemma 3.1 (Ma et al. (2009)). *There exists a positive constant $C_0 = 1 - \frac{\sqrt{2}}{2}$ such that for constant $H > 0$*

$$b(\psi, \psi) \geq C_0 |||\psi|||^2, \quad \forall \psi \in V^h. \quad (3.11)$$

Define an "energy" norm ([Sun and Ma (2010)])

$$\begin{aligned} \|\psi^n\|_{\mathcal{E}_1}^2 &= \|\partial_t \psi^n\|^2 + b(\psi^{n+\frac{1}{2}}, \psi^{n+\frac{1}{2}}) + c\|\psi^{n+\frac{1}{2}}\|^2 \\ &\quad - \frac{(\Delta t)^2}{4} \{2 < \overline{\partial_t \psi^n}, [\partial_t \psi^n] >_\Gamma + KH^{-1} < [\partial_t \psi^n], [\partial_t \psi^n] >_\Gamma\}. \end{aligned} \quad (3.12)$$

We turn to prove that the "energy" norm (3.12) is nonnegative under a time step constraint. To this end, we need the following inverse estimate ([Brenner and Scott (1996)])

$$\|\nabla \psi\| \leq C_2 h^{-1} \|\psi\|, \quad (3.13)$$

and the trace inequality

$$\|\psi\|_{L^2(\Gamma)}^2 \leq C_3 h^{-1} \|\psi\|^2. \quad (3.14)$$

Lemma 3.2 (Sun and Ma (2010)). *Denote $L = H/h$. There exists a positive constant C_1 such that for constant $H > 0$,*

$$\|\psi\|_{\mathcal{E}_1}^2 \geq \frac{1}{2} \|\partial_t \psi^n\|^2 + b(\psi^{n+\frac{1}{2}}, \psi^{n+\frac{1}{2}}) + c\|\psi^{n+\frac{1}{2}}\|^2, \quad (3.15)$$

provided that $\Delta t \leq C_1 H$, where $C_1 = \sqrt{\frac{2}{C_2^2 L^2 + 3K C_3 L}}$.

Lemma 3.3. *If $f = 0$, $U = 0$, there exists a positive constant C such that for $n = 1, 2, \dots, N$, the full discrete schemes (3.6) and (3.7) hold the following estimates in "energy" norm*

$$\|Y^n\|_{\mathcal{E}_1}^2 \leq \|Y^{n-1}\|_{\mathcal{E}_1}^2, \quad (3.16)$$

$$\|P^{n-1}\|_{\mathcal{E}_1}^2 \leq \|P^n\|_{\mathcal{E}_1}^2. \quad (3.17)$$

Proof. Estimate (3.16) can be obtained similarly from the proof of Lemma 3.5 in [Sun and Ma (2010)]. In equation (3.6), we take $v = \delta Y^n$ to get that

$$\begin{aligned} &(\partial_t^2 Y^n, \delta Y^n) + (\nabla Y^{n, \frac{1}{4}}, \nabla \delta Y^n) + c(Y^{n, \frac{1}{4}}, \delta Y^n) + < \overline{Y_{\Gamma, H}^{n, \frac{1}{4}}}, [\delta Y^n] >_\Gamma \\ &\quad + < \overline{\delta Y_{\Gamma, H}^n}, [Y^{n, \frac{1}{4}}] >_\Gamma + KH^{-1} < [Y^{n, \frac{1}{4}}], [\delta Y^n] >_\Gamma + < \delta Y^n, \delta Y^n >_{\Gamma_N} \\ &= < \overline{Y_{\Gamma, H}^{n, \frac{1}{4}}} - \overline{Y_{\Gamma, H}^n}, [\delta Y^n] >_\Gamma + < \overline{\delta Y_{\Gamma, H}^n}, [Y^{n, \frac{1}{4}} - Y^n] >_\Gamma + KH^{-1} < [Y^{n, \frac{1}{4}} - Y^n], [\delta Y^n] >_\Gamma. \end{aligned} \quad (3.18)$$

By the notations (3.4), we have the following results.

$$(i) \quad (\partial_t^2 Y^n, \delta Y^n) = \frac{1}{2\Delta t} \{\|\partial_t Y^n\|^2 - \|\partial_t Y^{n-1}\|^2\}. \quad (3.19)$$

$$\begin{aligned} (ii) \quad &(\nabla Y^{n, \frac{1}{4}}, \nabla \delta Y^n) + c(Y^{n, \frac{1}{4}}, \delta Y^n) \\ &= \frac{1}{2\Delta t} \{\|\nabla Y^{n+\frac{1}{2}}\|^2 - \|\nabla Y^{n-\frac{1}{2}}\|^2\} + \frac{c}{2\Delta t} \{\|Y^{n+\frac{1}{2}}\|^2 - \|Y^{n-\frac{1}{2}}\|^2\}. \end{aligned} \quad (3.20)$$

$$\begin{aligned} (iii) \quad &< \overline{Y_{\Gamma, H}^{n, \frac{1}{4}}}, [\delta Y^n] >_\Gamma + < \overline{\delta Y_{\Gamma, H}^n}, [Y^{n, \frac{1}{4}}] >_\Gamma + KH^{-1} < [Y^{n, \frac{1}{4}}], [\delta Y^n] >_\Gamma \\ &= \frac{1}{2\Delta t} \{2 < \overline{Y_{\Gamma, H}^{n+\frac{1}{2}}}, [Y^{n+\frac{1}{2}}] >_\Gamma + KH^{-1} < [Y^{n+\frac{1}{2}}], [Y^{n+\frac{1}{2}}] >_\Gamma \\ &\quad - 2 < \overline{Y_{\Gamma, H}^{n-\frac{1}{2}}}, [Y^{n-\frac{1}{2}}] >_\Gamma - KH^{-1} < [Y^{n-\frac{1}{2}}], [Y^{n-\frac{1}{2}}] >_\Gamma\}. \end{aligned} \quad (3.21)$$

(iv)

$$\begin{aligned}
 & \langle \overline{Y_{\tilde{\nu}_{\Gamma,H}}^{n,\frac{1}{4}}} - \overline{Y_{\tilde{\nu}_{\Gamma,H}}^n}, [\delta Y^n] \rangle_{\Gamma} + \langle \overline{\delta Y_{\tilde{\nu}_{\Gamma,H}}^n}, [Y^{n,\frac{1}{4}} - Y^n] \rangle_{\Gamma} + KH^{-1} \langle [Y^{n,\frac{1}{4}} - Y^n], [\delta Y^n] \rangle_{\Gamma} \\
 &= \frac{\Delta t}{8} \{ 2 \langle \overline{\partial_t Y_{\tilde{\nu}_{\Gamma,H}}^n}, [\partial_t Y^n] \rangle_{\Gamma} + KH^{-1} \langle [\partial_t Y^n], [\partial_t Y^n] \rangle_{\Gamma} \\
 &\quad - 2 \langle \overline{\partial_t Y_{\tilde{\nu}_{\Gamma,H}}^{n-1}}, [\partial_t Y^{n-1}] \rangle_{\Gamma} - KH^{-1} \langle [\partial_t Y^{n-1}], [\partial_t Y^{n-1}] \rangle_{\Gamma} \}.
 \end{aligned} \tag{3.22}$$

Combining the above equalities (3.19)-(3.22) together, we can see that

$$\|Y^n\|_{\mathcal{E}_1}^2 + 2\Delta t \langle \delta Y^n, \delta Y^n \rangle_{\Gamma_N} = \|Y^{n-1}\|_{\mathcal{E}_1}^2. \tag{3.23}$$

Then, we have estimate (3.16).

Now, we turn to prove estimate (3.17). In equation (3.7), we take $w = -\delta P^n$ to have

$$\begin{aligned}
 & (\partial_t^2 P^n, -\delta P^n) + (\nabla P^{n,\frac{1}{4}}, -\nabla(\delta P^n)) + c(P^{n,\frac{1}{4}}, -\delta P^n) + \langle \overline{P_{\tilde{\nu}_{\Gamma,H}}^{n,\frac{1}{4}}}, [-\delta P^n] \rangle_{\Gamma} \\
 & \quad + \langle \overline{-\delta P_{\tilde{\nu}_{\Gamma,H}}^n}, [P^{n,\frac{1}{4}}] \rangle_{\Gamma} + KH^{-1} \langle [P^{n,\frac{1}{4}}], [-\delta P^n] \rangle_{\Gamma} + \{ \langle \overline{P_{\tilde{\nu}_{\Gamma,H}}^{n,\frac{1}{4}}} - \overline{P_{\tilde{\nu}_{\Gamma,H}}^n}, \\
 & \quad [\delta P^n] \rangle_{\Gamma} + \langle \overline{\delta P_{\tilde{\nu}_{\Gamma,H}}^n}, [P^{n,\frac{1}{4}} - P^n] \rangle_{\Gamma} + KH^{-1} \langle [P^{n,\frac{1}{4}} - P^n], [\delta P^n] \rangle_{\Gamma} \} \\
 &= \langle \delta P^n, -\delta P^n \rangle_{\Gamma_N}.
 \end{aligned} \tag{3.24}$$

By the notations (3.4) and direct calculations to the terms on the left-hand side of equation (3.24), we have the following results.

$$(1) \quad (\partial_t^2 P^n, -\delta P^n) = -\frac{1}{2\Delta t} \{ \|\partial_t P^n\|^2 - \|\partial_t P^{n-1}\|^2 \}. \tag{3.25}$$

$$\begin{aligned}
 (2) \quad & (\nabla P^{n,\frac{1}{4}}, -\nabla \delta P^n) + c(P^{n,\frac{1}{4}}, -\delta P^n) \\
 &= -\frac{1}{2\Delta t} \{ \|\nabla P^{n+\frac{1}{2}}\|^2 - \|\nabla P^{n-\frac{1}{2}}\|^2 \} - \frac{c}{2\Delta t} \{ \|P^{n+\frac{1}{2}}\|^2 - \|P^{n-\frac{1}{2}}\|^2 \}.
 \end{aligned} \tag{3.26}$$

$$\begin{aligned}
 (3) \quad & \langle \overline{P_{\tilde{\nu}_{\Gamma,H}}^{n,\frac{1}{4}}}, [-\delta P^n] \rangle_{\Gamma} + \langle \overline{-\delta P_{\tilde{\nu}_{\Gamma,H}}^n}, [P^{n,\frac{1}{4}}] \rangle_{\Gamma} + KH^{-1} \langle [P^{n,\frac{1}{4}}], [-\delta P^n] \rangle_{\Gamma} \\
 &= -\frac{1}{2\Delta t} \{ 2 \langle \overline{P_{\tilde{\nu}_{\Gamma,H}}^{n+\frac{1}{2}}}, [P^{n+\frac{1}{2}}] \rangle_{\Gamma} + KH^{-1} \langle [P^{n+\frac{1}{2}}], [P^{n+\frac{1}{2}}] \rangle_{\Gamma} \\
 &\quad - 2 \langle \overline{P_{\tilde{\nu}_{\Gamma,H}}^{n-\frac{1}{2}}}, [P^{n-\frac{1}{2}}] \rangle_{\Gamma} - KH^{-1} \langle [P^{n-\frac{1}{2}}], [P^{n-\frac{1}{2}}] \rangle_{\Gamma} \}.
 \end{aligned} \tag{3.27}$$

$$\begin{aligned}
 (4) \quad & \langle \overline{P_{\tilde{\nu}_{\Gamma,H}}^{n,\frac{1}{4}}} - \overline{P_{\tilde{\nu}_{\Gamma,H}}^n}, [-\delta P^n] \rangle_{\Gamma} + \langle \overline{-\delta P_{\tilde{\nu}_{\Gamma,H}}^n}, [P^{n,\frac{1}{4}} - P^n] \rangle_{\Gamma} \\
 & \quad + KH^{-1} \langle [P^{n,\frac{1}{4}} - P^n], [-\delta P^n] \rangle_{\Gamma} \\
 &= -\frac{\Delta t}{8} \{ 2 \langle \overline{\partial_t P_{\tilde{\nu}_{\Gamma,H}}^n}, [\partial_t P^n] \rangle_{\Gamma} + KH^{-1} \langle [\partial_t P^n], [\partial_t P^n] \rangle_{\Gamma} \\
 &\quad - 2 \langle \overline{\partial_t P_{\tilde{\nu}_{\Gamma,H}}^{n-1}}, [\partial_t P^{n-1}] \rangle_{\Gamma} - KH^{-1} \langle [\partial_t P^{n-1}], [\partial_t P^{n-1}] \rangle_{\Gamma} \}.
 \end{aligned} \tag{3.28}$$

By the above equalities (3.25)-(3.28), it follows

$$\|P^n\|_{\mathcal{E}_1}^2 - 2\Delta t \langle \delta P^n, \delta P^n \rangle_{\Gamma_N} = \|P^{n-1}\|_{\mathcal{E}_1}^2. \tag{3.29}$$

From this equation, it follows the estimate (3.17). $\square$

Remark 3.2. The results (3.16)-(3.17) show that the full discrete schemes (3.6)-(3.7) keep the conservation of "energy" under the condition $f = 0$, $U = 0$. This means that the schemes (3.6)-(3.7) are stable.

4 Error estimates

4.1 Auxiliary lemmas

First, the following approximation properties exist.

Lemma 4.1 (Ma et al. (2009)). *For smooth enough function v , there hold estimates*

$$\|\bar{v}_H - v\|_{L^2(\Gamma)} \leq \sqrt{2H} \|\nabla v\|_{L^2(\Omega)}, \quad (4.1)$$

$$\|\bar{v}_H - v\|_{L^\infty(\Gamma)} \leq CH^2 \|v\|_{W^{2,\infty}(\Omega)}, \quad (4.2)$$

and

$$v(x) - \bar{v}_H(x) = -\frac{1}{6}H^2 v_{\bar{\Gamma}}^2(x) - \frac{1}{120}H^4 v_{\bar{\Gamma}}^4(x) + o(H^6), \quad \forall x \text{ on } \Gamma, \quad (4.3)$$

where $v_{\bar{\Gamma}}^2(x)$ and $v_{\bar{\Gamma}}^4(x)$ are the second and fourth order normal derivatives of v on Γ , respectively.

Define an average operator $\Pi_h : M \rightarrow M^h$ on element τ_U satisfying

$$\Pi_h u|_{\tau_U} = \frac{1}{|\tau_U|} \int_{\tau_U} u, \quad \forall u \in M, \tau_U \in T_U^h, \quad (4.4)$$

where $|\tau_U|$ is the measure of element τ_U .

Lemma 4.2 (Zhu and Yuan (2009)). *For the average operator Π_h , there exists a positive constant C independent of h_U such that*

$$\|\psi - \Pi_h \psi\|_{L^2(\tau_U)} \leq Ch_U \|\psi\|_{H^1(\tau_U)}, \quad \forall \psi \in H^1(\tau_U). \quad (4.5)$$

Similar to the method of reference [Fu and Rui (2009)], we introduce an auxiliary problem: Find intermediate variables $\{Y^n(u), P^n(u)\}_{n=1}^N \in V^h \times V^h$, $n = 1, 2, \dots, N$ satisfying $\forall v, w \in V_0^h$

$$\begin{cases} (\partial_t^2 Y^n(u), v) + (\nabla Y^{n, \frac{1}{4}}(u), \nabla v) + c(Y^{n, \frac{1}{4}}(u), v) + \langle \bar{Y}_{\bar{\Gamma}, H}^n(u), [v] \rangle_\Gamma \\ \quad + \langle \bar{w}_{\bar{\Gamma}, H}, [Y^n(u)] \rangle_\Gamma + KH^{-1} \langle [Y^n(u)], [v] \rangle_\Gamma \\ = (f^{n, \frac{1}{4}}, v) + \langle u^{n, \frac{1}{4}}, v \rangle_{\Gamma_N} - \langle \delta Y^n(u), v \rangle_{\Gamma_N}, & \text{in } \Omega, \\ Y^0(u) = y_1, & \text{in } \Omega, \\ \partial_t Y^0(u) = y_2, & \text{in } \Omega, \end{cases} \quad (4.6)$$

and

$$\begin{cases} (\partial_t^2 P^n(u), w) + (\nabla P^{n, \frac{1}{4}}(u), \nabla w) + c(P^{n, \frac{1}{4}}(u), w) + \langle \bar{P}_{\bar{\Gamma}, H}^n(u), [w] \rangle_\Gamma \\ \quad + \langle \bar{w}_{\bar{\Gamma}, H}, [P^n(u)] \rangle_\Gamma + KH^{-1} \langle [P^n(u)], [w] \rangle_\Gamma \\ = \langle \delta P^n(u), w \rangle_{\Gamma_N}, & \text{in } \Omega, \\ P^N(u) = P^N + (Y^N(u) - Y^N), & \text{in } \Omega, \\ \partial_t P^{N-1}(u) = \partial_t P^{N-1} + (\partial_t Y^{N-1}(u) - \partial_t Y^{N-1}), & \text{in } \Omega. \end{cases} \quad (4.7)$$

Let

$$\begin{cases} \theta^n = Y^n - Y^n(u), & \eta^n = y^n - Y^n(u), & n = 0, 1, 2, \dots, N, \\ \zeta^n = P^n - P^n(u), & \xi^n = p^n - P^n(u), & n = N, N-1, \dots, 0. \end{cases} \quad (4.8)$$

It is clear to see that $\theta^0 = \theta^1 = 0$, $\zeta^N = \theta^N$, $\partial_t \zeta^{N-1} = \partial_t \theta^{N-1}$.

Lemma 4.3. Let $\{Y^n, P^n\}$ and $\{Y^n(u), P^n(u)\}$ be the solutions of the full discrete schemes (3.6)-(3.8) and the auxiliary problem (4.6)-(4.7), respectively. Then, there exists a positive constant C independent of h_U such that

$$\max_{0 \leq n \leq N} \|\partial_t \theta^n\|^2 + \max_{0 \leq n \leq N} \|\theta^n\|^2 \leq C \|u - U\|_{L^2(0,T;L^2(\Gamma_N))}^2, \quad (4.9)$$

$$\max_{0 \leq n \leq N} \|\partial_t \zeta^n\|^2 + \max_{0 \leq n \leq N} \|\zeta^n\|^2 \leq C \|u - U\|_{L^2(0,T;L^2(\Gamma_N))}^2, \quad (4.10)$$

where

$$\|u - U\|_{L^2(0,T;L^2(\Gamma_N))}^2 \stackrel{Def.}{=} \sum_{n=1}^{N-1} \Delta t \|u^{n,\frac{1}{4}} - U^{n,\frac{1}{4}}\|_{L^2(\Gamma_N)}^2.$$

Proof. Subtracting equation (4.6) from equation (3.6), we obtain $\forall v \in V_0^h$

$$\begin{aligned} & (\partial_t^2 \theta^n, v) + (\nabla \theta^{n,\frac{1}{4}}, \nabla v) + c(\theta^{n,\frac{1}{4}}, v) + \langle \overline{\theta_{\Gamma,H}^n}, [v] \rangle_\Gamma + \langle \overline{v_{\Gamma,H}^n}, [\theta^n] \rangle_\Gamma \\ & + KH^{-1} \langle [\theta^n], [v] \rangle_\Gamma = \langle U^{n,\frac{1}{4}} - u^{n,\frac{1}{4}}, v \rangle_{\Gamma_N} - \langle \delta \theta^n, v \rangle_{\Gamma_N}. \end{aligned} \quad (4.11)$$

Take $v = \delta \theta^n$ in equation (4.11) to have

$$\begin{aligned} & (\partial_t^2 \theta^n, \delta \theta^n) + (\nabla \theta^{n,\frac{1}{4}}, \nabla \delta \theta^n) + c(\theta^{n,\frac{1}{4}}, \delta \theta^n) + \langle \overline{\theta_{\Gamma,H}^n}, [\delta \theta^n] \rangle_\Gamma + \langle \overline{\delta \theta_{\Gamma,H}^n}, [\theta^n] \rangle_\Gamma \\ & + KH^{-1} \langle [\theta^n], [\delta \theta^n] \rangle_\Gamma = \langle U^{n,\frac{1}{4}} - u^{n,\frac{1}{4}}, \delta \theta^n \rangle_{\Gamma_N} - \langle \delta \theta^n, \delta \theta^n \rangle_{\Gamma_N}. \end{aligned} \quad (4.12)$$

By the notations (3.4), we know

$$c(\theta^{n,\frac{1}{4}}, \delta \theta^n) = \frac{c}{2\Delta t} \{\|\theta^{n+\frac{1}{2}}\|^2 - \|\theta^{n-\frac{1}{2}}\|^2\}. \quad (4.13)$$

From the proof of Lemma 3.3, equations (3.12) and (4.13), it follows

$$\text{the left-hand side of equation (4.12)} = \frac{1}{2\Delta t} \{\|\theta^n\|_{\mathcal{E}_1}^2 - \|\theta^{n-1}\|_{\mathcal{E}_1}^2\}. \quad (4.14)$$

Analyzing the right-hand side of equation (4.12), we get

$$| \langle U^{n,\frac{1}{4}} - u^{n,\frac{1}{4}}, \delta \theta^n \rangle_{\Gamma_N} | \leq \varepsilon \{\|\partial_t \theta^n\|^2 + \|\partial_t \theta^{n-1}\|^2\} + C \|U^{n,\frac{1}{4}} - u^{n,\frac{1}{4}}\|_{L^2(\Gamma_N)}^2, \quad (4.15)$$

and

$$| \langle \delta \theta^n, \delta \theta^n \rangle_{\Gamma_N} | \leq C \{\|\partial_t \theta^n\|^2 + \|\partial_t \theta^{n-1}\|^2\}, \quad (4.16)$$

where $0 < \varepsilon < \frac{1}{4}$ is chosen.

Combining estimates (4.14)-(4.16) together, multiplying both sides by $2\Delta t$, summing time up to n , and using the initial condition $\theta^0 = \theta^1 = 0$, we find

$$\|\theta^n\|_{\mathcal{E}_1}^2 \leq C\Delta t \sum_{l=1}^n \{\|\partial \theta^l\|^2 + \|\partial \theta^{l-1}\|^2\} + C\Delta t \sum_{l=1}^n \{\|U^{l,\frac{1}{4}} - u^{l,\frac{1}{4}}\|^2\}. \quad (4.17)$$

Then, from Lemmas 3.1, 3.2 and the discrete Gronwall lemma, it follows

$$\frac{1}{2} \|\partial_t \theta^n\|^2 + C_0 \|\theta^{n+\frac{1}{2}}\|^2 + c \|\theta^{n+\frac{1}{2}}\|^2 \leq C\Delta t \sum_{l=1}^n \|U^{l,\frac{1}{4}} - u^{l,\frac{1}{4}}\|_{L^2(\Gamma_N)}^2. \quad (4.18)$$

Furthermore, since there exist $\theta^{n+1} = \theta^{n+\frac{1}{2}} + \frac{\Delta t}{2} \partial_t \theta^n$ and $\theta^{\frac{1}{2}} = 0$, we achieve

$$\|\theta^{n+1}\| \leq C\Delta t \sum_{l=1}^n \|\partial_t \theta^l\|. \quad (4.19)$$

Then, estimate (4.9) can be derived by equations (4.17)-(4.18).

Next, we turn to prove estimate (4.10) similarly. Subtracting equation (4.7) from equation (3.7), we see $\forall w \in V_0^h$

$$\begin{aligned} & (\partial_t^2 \zeta^n, w) + (\nabla \zeta^{n, \frac{1}{4}}, \nabla w) + c(\zeta^{n, \frac{1}{4}}, w) + \langle \overline{\zeta_{\Gamma, H}^n}, [w] \rangle_\Gamma \\ & + \langle \overline{w_{\Gamma, H}}, [\zeta^n] \rangle_\Gamma + KH^{-1} \langle [\zeta^n], [w] \rangle_\Gamma = \langle \delta \zeta^n, w \rangle_{\Gamma_N}. \end{aligned} \quad (4.20)$$

In equation (4.20), taking $w = -\delta \zeta^n$ and similarly to the derivation of equation (4.9), we know

$$\text{the left-hand side of equation (4.20)} = \frac{1}{2\Delta t} \{ \|\zeta^{n-1}\|_{\mathcal{E}_1}^2 - \|\zeta^n\|_{\mathcal{E}_1}^2 \}, \quad (4.21)$$

and

$$| \langle \delta \zeta^n, -\delta \zeta^n \rangle_{\Gamma_N} | \leq C \{ \|\partial_t \zeta^n\|^2 + \|\partial_t \zeta^{n-1}\|^2 \}. \quad (4.22)$$

Thus, we get

$$\frac{1}{2\Delta t} \{ \|\zeta^{n-1}\|_{\mathcal{E}_1}^2 - \|\zeta^n\|_{\mathcal{E}_1}^2 \} \leq C \{ \|\partial_t \zeta^{n-1}\|^2 + \|\partial_t \zeta^n\|^2 \}. \quad (4.23)$$

For equation (4.23), multiplying both sides by $2\Delta t$, summing time up to n , we obtain

$$\begin{aligned} \|\zeta^{n-1}\|_{\mathcal{E}_1}^2 & \leq \|\zeta^N\|_{\mathcal{E}_1}^2 + C\Delta t \sum_{l=n}^N \{ \|\partial_t \zeta^l\|^2 + \|\partial_t \zeta^{l-1}\|^2 \} \\ & \leq \|\theta^N\|^2 + C\Delta t \sum_{l=n}^N \{ \|\partial_t \zeta^l\|^2 + \|\partial_t \zeta^{l-1}\|^2 \}. \end{aligned} \quad (4.24)$$

Then, from Lemmas 3.1, 3.2, the discrete Gronwall lemma and equation (4.9), it follows

$$\frac{1}{2} \|\partial_t \zeta^{n-1}\|^2 + C_0 \|\zeta^{n+\frac{1}{2}}\|^2 + c \|\zeta^{n+\frac{1}{2}}\|^2 \leq C \|u - U\|_{l^2(0, T; L^2(\Gamma_N))}^2. \quad (4.25)$$

By $\zeta^{n-1} = \zeta^{n-\frac{1}{2}} - \frac{\Delta t}{2} \partial_t \zeta^{n-1}$, it is easy to bound

$$\|\zeta^{n-1}\| \leq \|\zeta^N\| + \Delta t \sum_{l=n}^N \|\partial_t \zeta^l\| \leq \|\theta^N\| + \Delta t \sum_{l=n}^N \|\partial_t \zeta^l\|. \quad (4.26)$$

Then, estimate (4.10) follows from equations (4.25)-(4.26). $\square$

4.2 The error estimate of $u - U$

We turn to derive the error estimate of $u - U$ bounded by $p - P(u)$.

Lemma 4.4. *Let $\{y, p, u\}$ and $\{Y, P, U\}$ be the solutions of the optimality system (2.2)-(2.4) and the full discrete schemes (3.6)-(3.8), respectively. Assume $u \in L^2(0, T; H^1(\Gamma_N))$, $p \in W$, there exists a positive constant C independent of h_U such that*

$$\|u - U\|_{l^2(0, T; L^2(\Gamma_N))}^2 \leq Ch_U^2 + C \|p - P(u)\|_{l^2(0, T; L^2(\Omega))}^2. \quad (4.27)$$

Proof. By direct calculation, we have

$$\begin{aligned}
 & \alpha \|u - U\|_{L^2(0,T;L^2(\Gamma_N))}^2 = \alpha \Delta t \sum_{n=1}^{N-1} \|u^{n,\frac{1}{4}} - U^{n,\frac{1}{4}}\|_{L^2(\Gamma_N)}^2 \\
 = & \sum_{n=1}^{N-1} \Delta t < \alpha u^{n,\frac{1}{4}} + p^{n,\frac{1}{4}}, u^{n,\frac{1}{4}} - U^{n,\frac{1}{4}} >_{\Gamma_N} + \sum_{n=1}^{N-1} \Delta t < \alpha U^{n,\frac{1}{4}} + P^{n,\frac{1}{4}}(u), \\
 & U^{n,\frac{1}{4}} - u^{n,\frac{1}{4}} >_{\Gamma_N} + \Delta t \sum_{n=1}^{N-1} < P^{n,\frac{1}{4}}(u) - p^{n,\frac{1}{4}}, u^{n,\frac{1}{4}} - U^{n,\frac{1}{4}} >_{\Gamma_N} \\
 \leq & \Delta t \sum_{n=1}^{N-1} < \alpha U^{n,\frac{1}{4}} + P^{n,\frac{1}{4}}(u), U^{n,\frac{1}{4}} - u^{n,\frac{1}{4}} >_{\Gamma_N} \\
 & + \Delta t \sum_{n=1}^{N-1} < P^{n,\frac{1}{4}}(u) - p^{n,\frac{1}{4}}, u^{n,\frac{1}{4}} - U^{n,\frac{1}{4}} >_{\Gamma_N} \\
 \leq & \Delta t \sum_{n=1}^{N-1} < \alpha U^{n,\frac{1}{4}}, \Pi_h u^{n,\frac{1}{4}} - u^{n,\frac{1}{4}} >_{\Gamma_N} + \Delta t \sum_{n=1}^{N-1} < p^{n,\frac{1}{4}}, \Pi_h u^{n,\frac{1}{4}} - u^{n,\frac{1}{4}} >_{\Gamma_N} \\
 & + \Delta t \sum_{n=1}^{N-1} < p^{n,\frac{1}{4}} - P^{n,\frac{1}{4}}(u), u^{n,\frac{1}{4}} - \Pi_h u^{n,\frac{1}{4}} >_{\Gamma_N} + \Delta t \sum_{n=1}^{N-1} < P^{n,\frac{1}{4}}(u) - \\
 & P^{n,\frac{1}{4}}, u^{n,\frac{1}{4}} - \Pi_h u^{n,\frac{1}{4}} >_{\Gamma_N} + \Delta t \sum_{n=1}^{N-1} < P^{n,\frac{1}{4}}(u) - P^{n,\frac{1}{4}}, U^{n,\frac{1}{4}} - u^{n,\frac{1}{4}} >_{\Gamma_N} \\
 & + \Delta t \sum_{n=1}^{N-1} < P^{n,\frac{1}{4}}(u) - p^{n,\frac{1}{4}}, u^{n,\frac{1}{4}} - U^{n,\frac{1}{4}} >_{\Gamma_N} \\
 \stackrel{Def.}{=} & \sum_{i=1}^6 I_i.
 \end{aligned} \tag{4.28}$$

Now, we analyze the terms I_1 to I_6 one by one. By the definition of operator Π_h in equation (4.4), there holds

$$I_1 = \Delta t \sum_{n=1}^{N-1} < \alpha U^{n,\frac{1}{4}}, \Pi_h u^{n,\frac{1}{4}} - u^{n,\frac{1}{4}} >_{\Gamma_N} = 0. \tag{4.29}$$

From Lemma 4.2, we know

$$I_2 \leq Ch_U^2 \Delta t \sum_{n=1}^N (\|p^{n,\frac{1}{4}}\|_{H^1(\Omega)}^2 + \|u^{n,\frac{1}{4}}\|_{H^1(\Gamma_N)}^2) \leq Ch_U^2, \tag{4.30}$$

and

$$I_3 \leq C \|p - P(u)\|_{L^2(0,T;L^2(\Omega))}^2 + Ch_U^2. \tag{4.31}$$

By Lemmas 4.2 and 4.3, we see

$$I_4 \leq \varepsilon \|U - u\|_{L^2(0,T;L^2(\Gamma_N))}^2 + Ch_U^2, \tag{4.32}$$

where ε is an arbitrary positive constant.

It is now to bound the term I_5 . In equation (4.11), we take $v = \zeta^{n,\frac{1}{4}}$ to obtain

$$\begin{aligned}
 & (\partial_t^2 \theta^n, \zeta^{n,\frac{1}{4}}) + (\nabla \theta^{n,\frac{1}{4}}, \nabla \zeta^{n,\frac{1}{4}}) + c(\theta^{n,\frac{1}{4}}, \zeta^{n,\frac{1}{4}}) + < \overline{\theta_{\Gamma,H}^n}, [\zeta^{n,\frac{1}{4}}] >_{\Gamma} + < \overline{\zeta_{\Gamma,H}^{n,\frac{1}{4}}}, [\theta^n] >_{\Gamma} \\
 & + KH^{-1} < [\theta^n], [\zeta^{n,\frac{1}{4}}] >_{\Gamma} = < U^{n,\frac{1}{4}} - u^{n,\frac{1}{4}}, \zeta^{n,\frac{1}{4}} >_{\Gamma_N} - < \delta \theta^n, \zeta^{n,\frac{1}{4}} >_{\Gamma_N}.
 \end{aligned} \tag{4.33}$$

By $\theta^0 = \theta^1 = 0, \zeta^N = \theta^N, \partial_t \zeta^{N-1} = \partial_t \theta^N$, sum time up to n and utilize the discrete Green formula to have

$$(1) \quad \Delta t \sum_{n=1}^{N-1} (\partial_t^2 \theta^n, \zeta^{n, \frac{1}{4}}) = \Delta t \sum_{n=1}^{N-1} (\partial_t^2 \zeta^n, \theta^{n, \frac{1}{4}}), \quad (4.34)$$

$$(2) \quad \begin{aligned} & \sum_{n=1}^{N-1} \Delta t \{ \langle \overline{\theta_{\Gamma, H}^n}, [\zeta^{n, \frac{1}{4}}] \rangle_{\Gamma} + \langle \overline{\zeta_{\Gamma, H}^n}, [\theta^n] \rangle_{\Gamma} + KH^{-1} \langle [\theta^n], [\zeta^{n, \frac{1}{4}}] \rangle_{\Gamma} \} \\ &= \sum_{n=1}^{N-1} \Delta t \{ \langle \overline{\theta_{\Gamma, H}^n}, [\zeta^n] \rangle_{\Gamma} + \langle \overline{\zeta_{\Gamma, H}^n}, [\theta^{n, \frac{1}{4}}] \rangle_{\Gamma} + KH^{-1} \langle [\theta^{n, \frac{1}{4}}], [\zeta^n] \rangle_{\Gamma} \}. \end{aligned} \quad (4.35)$$

Hence, we find

$$\begin{aligned} I_5 &= - \sum_{n=1}^{N-1} \Delta t \langle \zeta^{n, \frac{1}{4}}, U^{n, \frac{1}{4}} - u^{n, \frac{1}{4}} \rangle_{\Gamma_N} \\ &= - \sum_{n=1}^{N-1} \Delta t \{ (\partial_t^2 \theta^n, \zeta^{n, \frac{1}{4}}) + (\nabla \theta^{n, \frac{1}{4}}, \nabla \zeta^{n, \frac{1}{4}}) + c(\theta^{n, \frac{1}{4}}, \zeta^{n, \frac{1}{4}}) + \langle \overline{\theta_{\Gamma, H}^n}, [\zeta^{n, \frac{1}{4}}] \rangle_{\Gamma} \\ &\quad + \langle \overline{\zeta_{\Gamma, H}^n}, [\theta^n] \rangle_{\Gamma} + KH^{-1} \langle [\theta^n], [\zeta^{n, \frac{1}{4}}] \rangle_{\Gamma} + \langle \delta \theta^n, \zeta^{n, \frac{1}{4}} \rangle_{\Gamma_N} \} \\ &= - \sum_{n=1}^{N-1} \{ (\partial_t^2 \zeta^n, \theta^{n, \frac{1}{4}}) + (\nabla \zeta^{n, \frac{1}{4}}, \nabla \theta^{n, \frac{1}{4}}) + c(\zeta^{n, \frac{1}{4}}, \theta^{n, \frac{1}{4}}) + \langle \overline{\zeta_{\Gamma, H}^n}, [\theta^{n, \frac{1}{4}}] \rangle_{\Gamma} \\ &\quad + \langle \overline{\theta_{\Gamma, H}^n}, [\zeta^n] \rangle_{\Gamma} + KH^{-1} \langle [\zeta^n], [\theta^{n, \frac{1}{4}}] \rangle_{\Gamma} + \langle \delta \theta^n, \zeta^{n, \frac{1}{4}} \rangle_{\Gamma_N} \} \\ &= - \sum_{n=1}^{N-1} \Delta t \{ \langle \delta \zeta^n, \theta^{n, \frac{1}{4}} \rangle_{\Gamma_N} + \langle \delta \theta^n, \zeta^{n, \frac{1}{4}} \rangle_{\Gamma_N} \} \\ &= - \langle \zeta^{N-1, \frac{1}{2}}, \theta^{N-1, \frac{1}{2}} \rangle_{\Gamma_N} \\ &\leq 0. \end{aligned} \quad (4.36)$$

It is easy to bound the last term as

$$I_6 \leq C \|P(u) - p\|_{L^2(0, T; L^2(\Omega))}^2 + \varepsilon \|u - U\|_{L^2(0, T; L^2(\Gamma_N))}^2. \quad (4.37)$$

By estimates (4.28)-(4.37), taking $\varepsilon \leq \frac{\alpha}{4}$, we derive

$$\|u - U\|_{L^2(0, T; L^2(\Gamma_N))}^2 \leq Ch_U^2 + C \|p - P(u)\|_{L^2(0, T; L^2(\Omega))}^2. \quad (4.38)$$

Then, the proof of Lemma 4.4 is completed. $\square$

4.3 The error estimates of $y - Y(u)$ and $p - P(u)$

We adopt the standard elliptic projection $\tilde{w} \in V^h$ of $w \in V$

$$(\nabla(w - \tilde{w}), \nabla v) + c(w - \tilde{w}, v) = 0, \quad \forall v \in V^h. \quad (4.39)$$

By [Ciarlet (1978); Nitsche (1979); Schatz and Wahlbin (1978, 1979)], we know that

Lemma 4.5. *For elliptic projection (4.39), there exists the following L^∞ -norm error estimate*

$$\begin{aligned} & \|w - \tilde{w}\|_{L^\infty(\Omega)} + \|(w - \tilde{w})_t\|_{L^\infty(\Omega)} + \|(w - \tilde{w})_{tt}\|_{L^\infty(\Omega)} \\ &\leq Ch^2 |\ln h| \{ \|w\|_{W^{2, \infty}(\Omega)} + \|w_t\|_{W^{2, \infty}(\Omega)} + \|w_{tt}\|_{W^{2, \infty}(\Omega)} \}. \end{aligned} \quad (4.40)$$

As we have shown, the full discrete schemes (3.6) and (3.8) include two special terms on the inter-domain boundary Γ by integral mean method to present explicit flux calculation. The standard elliptic projection (4.39) is insufficient for deriving optimal error estimates. To get optimal error estimates, a new elliptic projection which includes the terms of inter-domain boundary was introduced in [Ma et al. (2009)]. This new elliptic projection $w_I \in V^h$ of the solution $w \in V$ is defined as follows: $\forall v \in V_0^h$

$$\begin{aligned} & (\nabla(w - w_I), \nabla v) + c(w - w_I, v) + \langle \overline{(w - w_I)}_{\bar{v}_{\Gamma, H}}, [v] \rangle_{\Gamma} \\ & + \langle \overline{v}_{\bar{v}_{\Gamma, H}}, [w - w_I] \rangle_{\Gamma} + KH^{-1} \langle [w - w_I], [v] \rangle_{\Gamma} = 0. \end{aligned} \quad (4.41)$$

Lemma 4.6 (Ma et al. (2009)). *For $w - w_I$, there exists error estimate*

$$\begin{cases} \|w - w_I\| \leq C\{h^2 + H^{1/2}\|w - \tilde{w}\|_{L^\infty}\}, \\ \|(w - w_I)_t\| \leq C\{h^2 + H^{1/2}\|(w - \tilde{w})_t\|_{L^\infty}\}, \\ \|(w - w_I)_{tt}\| \leq C\{h^2 + H^{1/2}\|(w - \tilde{w})_{tt}\|_{L^\infty}\}, \\ \|\nabla(w - w_I)_{tt}\| \leq C\{h + H^{1/2}\|\nabla(w - \tilde{w})_{tt}\|_{L^\infty}\}, \end{cases} \quad (4.42)$$

where $\tilde{w}$ is the elliptic projection defined by equation (4.39).

Lemma 4.7. *Let $\{y, p\}, \{Y(u), P(u)\}$ be the solutions of the optimality system (2.2)-(2.4) and auxiliary problem (4.6)-(4.7), respectively. Supposing that $y, p \in L^2(0, T; H^1(\Omega)) \cap H^2(0, T; L^2(\Omega))$ and $H = O(h^{\frac{4}{5}})$, there exists a positive constant C independent of h, H and Δt such that*

$$\max_{1 \leq n \leq N} \|\partial_t \eta^n\| + \max_{1 \leq n \leq N} \|\eta^n\| \leq C\{(\Delta t)^2 + h^2 + H^{5/2}\}, \quad (4.43)$$

$$\max_{1 \leq n \leq N} \|\partial_t \xi^n\| + \max_{1 \leq n \leq N} \|\xi^n\| \leq C\{(\Delta t)^2 + h^2 + H^{5/2}\}, \quad (4.44)$$

provided that $\Delta t \leq C_1 H$, where constant C_1 is defined by Lemma 3.2.

Proof. **Part 1.** By equation (2.2), we have the weak formulation $\forall v \in V_0^h$

$$\begin{aligned} & (\partial_t^2 y^n, v) + (\nabla y^{n, \frac{1}{4}}, \nabla v) + c(y^{n, \frac{1}{4}}, v) + \langle y_{\bar{v}_{\Gamma, H}}^{n, \frac{1}{4}}, [v] \rangle_{\Gamma} \\ & = (f^{n, \frac{1}{4}}, v) + \langle u^{n, \frac{1}{4}} - \partial_t y^{n, \frac{1}{4}}, v \rangle_{\Gamma_N} + (\partial_t^2 y^n - \frac{\partial^2 y^{n, \frac{1}{4}}}{\partial t^2}, v), \end{aligned} \quad (4.45)$$

where

$$\|\partial_t^2 y^n - \frac{\partial^2 y^{n, \frac{1}{4}}}{\partial t^2}\|^2 \leq (\Delta t)^3 \int_{t^{n-1}}^{t^{n+1}} \|\frac{\partial^4 y}{\partial t^4}\| dt \leq C(\Delta t)^3 \quad (4.46)$$

follows [Dupont (1973)].

Let $y_I \in V^h$ is the elliptic projection of y by equation (4.41). Define $\beta = y - y_I$, $\rho = Y(u) - y_I$. Combining equations (4.41) and (4.45) together, we know

$$\begin{aligned} & (\partial_t^2 y_I^n, v) + (\nabla y_I^{n, \frac{1}{4}}, \nabla v) + c(y_I^{n, \frac{1}{4}}, v) + \langle \overline{y_{I, \bar{v}_{\Gamma, H}}^n}, [v] \rangle_{\Gamma} \\ & + \langle \overline{v}_{\bar{v}_{\Gamma, H}}, [y_I^n] \rangle_{\Gamma} + KH^{-1} \langle [y_I^n], [v] \rangle_{\Gamma} \\ & = (f^{n, \frac{1}{4}}, v) + \langle u^{n, \frac{1}{4}}, v \rangle_{\Gamma_N} + \langle \delta y^n - \partial_t y^{n, \frac{1}{4}}, v \rangle_{\Gamma_N} + (\partial_t^2 y^n - \frac{\partial^2 y^{n, \frac{1}{4}}}{\partial t^2}, v) \\ & + \langle \overline{y_{\bar{v}_{\Gamma, H}}^n} - y_{\bar{v}_{\Gamma, H}}^n, [v] \rangle_{\Gamma} + \langle y_{\bar{v}_{\Gamma, H}}^n - y_{\bar{v}_{\Gamma, H}}^{n, \frac{1}{4}}, [v] \rangle_{\Gamma} - \langle \delta \beta^n, v \rangle_{\Gamma_N} \\ & - (\nabla(\beta^{n, \frac{1}{4}} - \beta^n), \nabla v) - (\partial_t^2 \beta^n, v) - c(\beta^{n, \frac{1}{4}}, v) - \langle \delta y_I^n, v \rangle_{\Gamma_N}. \end{aligned} \quad (4.47)$$

Subtracting equation (4.47) from equations (4.6), we obtain

$$\begin{aligned}
 & (\partial_t^2 \rho^n, v) + (\nabla \rho^{n, \frac{1}{4}}, \nabla v) + c(\rho^{n, \frac{1}{4}}, v) + \langle \overline{\rho_{\Gamma, H}^n}, [v] \rangle_\Gamma \\
 & + \langle \overline{v_{\Gamma, H}^n}, [\rho^n] \rangle_\Gamma + KH^{-1} \langle [\rho^n], [v] \rangle_\Gamma \\
 = & (\nabla(\beta^{n, \frac{1}{4}} - \beta^n), \nabla v) + c(\beta^{n, \frac{1}{4}}, v) - \langle \overline{y_{\Gamma, H}^n} - y_{\Gamma, H}^n, [v] \rangle_\Gamma \\
 & - \langle y_{\Gamma, H}^n - y_{\Gamma, H}^{n, \frac{1}{4}}, [v] \rangle_\Gamma + (\partial_t^2 \beta^n, v) - (\partial_t^2 y^n - \frac{\partial^2 y^n}{\partial t^2}, v) \\
 & + \langle \delta \beta^n, v \rangle_{\Gamma_N} - \langle \delta y^n - \partial_t y^{n, \frac{1}{4}}, v \rangle_{\Gamma_N} - \langle \delta \rho^n, v \rangle_{\Gamma_N}.
 \end{aligned} \tag{4.48}$$

Taking $v = \delta \rho^n$ in equation (4.48), we analyze the terms one by one. Similarly to the derivation of equation (4.14), it follows

$$\text{the left-hand side of equation (4.48)} = \frac{1}{2\Delta t} \{ \|\rho^n\|_{\mathcal{E}_1}^2 - \|\rho^{n-1}\|_{\mathcal{E}_1}^2 \}. \tag{4.49}$$

It is easy to see that the following estimates exist

$$\begin{aligned}
 |(\nabla(\beta^{n, \frac{1}{4}} - \beta^n), \nabla \delta \rho^n)| & \leq \varepsilon \{ \|\nabla \rho^{n+\frac{1}{2}}\|^2 + \|\nabla \rho^{n-\frac{1}{2}}\|^2 \} + C(\Delta t)^2 \|\nabla \partial_t^2 \beta^n\|^2, \\
 |c(\beta^{n, \frac{1}{4}}, \delta \rho^n)| & \leq C \{ \|\partial_t \rho^n\|^2 + \|\partial_t \rho^{n-1}\|^2 \} + C \{ \|\beta^{n+\frac{1}{2}}\|^2 + \|\beta^{n-\frac{1}{2}}\|^2 \}, \\
 |\langle \delta \beta^n, \delta \rho^n \rangle_{\Gamma_N}| & \leq C \{ \|\partial_t \rho^n\|^2 + \|\partial_t \rho^{n-1}\|^2 \} + C \{ \|\partial_t \beta^n\|^2 + \|\partial_t \beta^{n-1}\|^2 \}, \\
 |\langle \delta \rho^n, \delta \rho^n \rangle_{\Gamma_N}| & \leq C \{ \|\partial_t \rho^n\|^2 + \|\partial_t \rho^{n-1}\|^2 \}, \\
 |(\partial_t^2 \beta^n, \delta \rho^n)| & \leq \frac{\varepsilon}{2} \{ \|\partial_t \rho^n\|^2 + \|\partial_t \rho^{n-1}\|^2 \} + C \|\partial_t^2 \beta^n\|^2, \\
 |(\partial_t^2 y^n - \frac{\partial^2 y^{n, \frac{1}{4}}}{\partial t^2}, \delta \rho^n)| & \leq \frac{\varepsilon}{2} \{ \|\partial_t \rho^n\|^2 + \|\partial_t \rho^{n-1}\|^2 \} + C(\Delta t)^3,
 \end{aligned} \tag{4.50}$$

and

$$\begin{aligned}
 & |\langle y_{\Gamma, H}^{n, \frac{1}{4}} - y_{\Gamma, H}^n, [\delta \rho^n] \rangle_\Gamma| \\
 & \leq \frac{1}{2\Delta t} \{ \frac{\mu}{2} KH^{-1} \{ \|\rho^{n+\frac{1}{2}}\|_{L^2(\Gamma)}^2 + \|\rho^{n-\frac{1}{2}}\|_{L^2(\Gamma)}^2 \} + CH^5 \|y_{tt}(\tilde{t})\|_{H^2(\Omega)}^2 \},
 \end{aligned} \tag{4.51}$$

where, $\tilde{t} \in (t^{n-1}, t^{n+1})$, arbitrary constants $\varepsilon > 0$ and $0 < \mu < 1$.

Noticing that there exists

$$\left| \frac{\partial y^{n, \frac{1}{4}}}{\partial t} - \delta y^n \right| = \left| \frac{1}{4} \int_{-\Delta t}^{\Delta t} (\Delta t - |\tau|) \frac{|\tau|}{\Delta t} \frac{\partial^3 y}{\partial t^3}(t^n + \tau) d\tau \right| \leq C(\Delta t)^3. \tag{4.52}$$

Then, we know

$$\left| \langle \frac{\partial y^{n, \frac{1}{4}}}{\partial t} - \delta y^n, \delta \rho^n \rangle_{\Gamma_N} \right| \leq C \{ \|\partial_t \rho^n\|^2 + \|\partial_t \rho^{n-1}\|^2 \} + C(\Delta t)^3. \tag{4.53}$$

From Lemma 4.1, we also know

$$\begin{aligned}
 & |\langle \overline{y_{\Gamma, H}^n} - y_{\Gamma, H}^n, [\delta \rho^n] \rangle_\Gamma| \\
 & \leq \frac{1}{2\Delta t} \{ CH^5 \|y_{\Gamma, H}^n\|_{W^{2, \infty}(\Omega)}^2 + \frac{\mu}{2} KH^{-1} \{ \|\rho^{n+\frac{1}{2}}\|_{L^2(\Gamma)}^2 + \|\rho^{n-\frac{1}{2}}\|_{L^2(\Gamma)}^2 \} \}.
 \end{aligned} \tag{4.54}$$

Collecting the above analysis together, and noticing $0 < \mu < 1$, we find

$$\begin{aligned}
 & (1 - \mu) \|\rho^n\|_{\mathcal{E}_1}^2 - (1 + \mu) \|\rho^{n-1}\|_{\mathcal{E}_1}^2 \\
 & \leq C\Delta t \{ \|\nabla \rho^{n+\frac{1}{2}}\|^2 + \|\nabla \rho^{n-\frac{1}{2}}\|^2 + \|\partial_t \rho^n\|^2 + \|\partial_t \rho^{n-1}\|^2 \} \\
 & + C\Delta t \{ (\Delta t)^3 + \|\partial_t^2 \beta^n\|^2 + (\Delta t)^2 \|\nabla \partial_t^2 \beta^n\|^2 + \|\beta^{n+\frac{1}{2}}\|^2 + \|\beta^{n-\frac{1}{2}}\|^2 \\
 & + \|\partial_t \beta^n\|^2 + \|\partial_t \beta^{n-1}\|^2 \} + CH^5.
 \end{aligned} \tag{4.55}$$

Define $\lambda = \frac{1-\mu}{1+\mu}$. Then, we see $0 < \lambda < 1$. Multiplying both sides of equation (4.55) by $\frac{\lambda^{n-1}}{1+\mu}$, we have

$$\begin{aligned} & \lambda^n \|\rho^n\|_{\mathcal{E}_1}^2 - \lambda^{n-1} \|\rho^{n-1}\|_{\mathcal{E}_1}^2 \\ & \leq C\Delta t \{ \|\nabla \rho^{n+\frac{1}{2}}\|^2 + \|\nabla \rho^{n-\frac{1}{2}}\|^2 + \|\partial_t \rho^n\|^2 + \|\partial_t \rho^{n-1}\|^2 \} \\ & \quad + C\Delta t \{ (\Delta t)^3 + \|\partial_t^2 \beta^n\|^2 + (\Delta t)^2 \|\nabla \partial_t^2 \beta^n\|^2 + \|\beta^{n+\frac{1}{2}}\|^2 + \|\beta^{n-\frac{1}{2}}\|^2 \\ & \quad + \|\partial_t \beta^n\|^2 + \|\partial_t \beta^{n-1}\|^2 \} + CH^5. \end{aligned} \quad (4.56)$$

Summing time up to n , we obtain

$$\begin{aligned} \lambda^n \|\rho^n\|_{\mathcal{E}_1}^2 & \leq 2C\Delta t \frac{\lambda^{n-1}}{1+\mu} \sum_{l=1}^n \{ \|\nabla \rho^{l+\frac{1}{2}}\|^2 + \|\nabla \rho^{l-\frac{1}{2}}\|^2 + \|\partial_t \rho^l\|^2 + \|\rho^{l-1}\|^2 \} \\ & \quad + C\Delta t \sum_{l=1}^n \{ (\Delta t)^3 + \|\partial_t^2 \beta^l\|^2 + (\Delta t)^2 \|\nabla \partial_t^2 \beta^l\|^2 + \|\beta^{l+\frac{1}{2}}\|^2 \\ & \quad + \|\beta^{l-\frac{1}{2}}\|^2 + \|\partial_t \beta^l\|^2 + \|\partial_t \beta^{l-1}\|^2 \} + CH^5. \end{aligned} \quad (4.57)$$

Choosing $\mu = \frac{1}{1+N}$, we know $\lambda^{-n} = (1 + \frac{2}{N})^n < e^2$. By the discrete Gronwall lemma, Lemmas 3.1 and 3.2, there holds

$$\begin{aligned} & \frac{1}{2} \|\partial_t \rho^n\|^2 + C_0 \|\rho^n\|^2 + c \|\rho^{n+\frac{1}{2}}\|^2 \\ & \leq C\Delta t \sum_{l=1}^n \{ (\Delta t)^3 + \|\partial_t^2 \beta^l\|^2 + (\Delta t)^2 \|\nabla \partial_t^2 \beta^l\|^2 + \|\beta^{l+\frac{1}{2}}\|^2 + \|\beta^{l-\frac{1}{2}}\|^2 \\ & \quad + \|\partial_t \beta^l\|^2 + \|\partial_t \beta^{l-1}\|^2 \} + CH^5. \end{aligned} \quad (4.58)$$

Using the equality $\partial_t^2 \beta^l = (\Delta t)^{-2} \int_{-\Delta t}^{\Delta t} (\Delta t - |\tau|) \frac{\partial^2 \beta}{\partial t^2}(t^l + \tau) d\tau$ ([Dupont (1973)]), we derive

$$\begin{cases} \Delta t \sum_{l=1}^n \|\partial_t^2 \beta^l\|^2 & \leq C \left\| \frac{\partial^2 \beta}{\partial t^2} \right\|_{L^2(0,T;L^2(\Omega))}^2, \\ \Delta t \sum_{l=1}^n \|\nabla \partial_t^2 \beta^l\|^2 & \leq C \left\| \frac{\partial^2 \beta}{\partial t^2} \right\|_{L^2(0,T;H^1(\Omega))}^2. \end{cases} \quad (4.59)$$

By the equality $\rho^{n+1} = \rho^{n+\frac{1}{2}} + \frac{\Delta t}{2} \partial_t \rho^n$ and $\rho^{\frac{1}{2}} = 0$, there exists

$$\|\rho^{n+1}\| \leq \Delta t \sum_{l=1}^n \|\partial_t \rho^l\|. \quad (4.60)$$

Putting equations (4.58)-(4.60) together and using Lemma 4.6, we can obtain estimate (4.43).

Part 2. This next step is to estimate the error between p and $P(u)$. The weak formulation of equation (2.3) is $\forall w \in V_0^h$

$$(\partial_t^2 p^n, w) + (\nabla p^{n,\frac{1}{4}}, \nabla w) + c(p^{n,\frac{1}{4}}, w) + \langle p_{\Gamma}^{n,\frac{1}{4}}, [w] \rangle_{\Gamma} = \langle d_t p^{n,\frac{1}{4}}, w \rangle_{\Gamma_N} + (\partial_t^2 p^n - \frac{\partial^2 p^{n,\frac{1}{4}}}{\partial t^2}, w), \quad (4.61)$$

where $\|\partial_t^2 p^n - \frac{\partial^2 p^{n,\frac{1}{4}}}{\partial t^2}\|^2 \leq C(\Delta t)^3$.

Define the elliptic projection p_I of p by equation (4.41). Let $\varphi = p - p_I, \psi = P(u) - p_I$. There

exists

$$\begin{aligned}
 & (\partial_t^2 p_I^n, w) + (\nabla p_I^{n, \frac{1}{4}}, \nabla w) + c(p^{n, \frac{1}{4}}, w) \\
 & + \langle \overline{p_{I, \bar{\nu}_{\Gamma, H}}^n}, [w] \rangle_{\Gamma} + \langle \overline{w_{\bar{\nu}_{\Gamma, H}}}, [p_I^n] \rangle_{\Gamma} + KH^{-1} \langle [p_I^n], [w] \rangle_{\Gamma} \\
 = & \langle d_t p^{n, \frac{1}{4}} - \delta p^n, w \rangle_{\Gamma_N} + (\partial_t^2 p^n - \frac{\partial^2 p^{n, \frac{1}{4}}}{\partial t^2}, w) - \langle p_{\bar{\nu}}^{n, \frac{1}{4}} - p_{\bar{\nu}}^n, [w] \rangle_{\Gamma} \\
 & + \langle \overline{p_{\bar{\nu}_{\Gamma, H}}^n} - p_{\bar{\nu}_{\Gamma, H}}^n, [w] \rangle_{\Gamma} - (\partial_t^2 \varphi^n, w) - (\nabla(\varphi^{n, \frac{1}{4}} - \varphi^n), \nabla w) \\
 & - c(\varphi^{n, \frac{1}{4}}, w) + \langle \delta \varphi^n, w \rangle_{\Gamma_N} + \langle \delta p_I^n, w \rangle_{\Gamma_N}.
 \end{aligned} \tag{4.62}$$

Subtracting equation (4.62) from equation (4.7), we have

$$\begin{aligned}
 & (\partial_t^2 \psi^n, w) + (\nabla \psi^{n, \frac{1}{4}}, \nabla w) + c(\psi^{n, \frac{1}{4}}, w) \\
 & + \langle \overline{\psi_{\bar{\nu}_{\Gamma, H}}^n}, [w] \rangle_{\Gamma} + \langle \overline{w_{\bar{\nu}_{\Gamma, H}}}, [\psi^n] \rangle_{\Gamma} + KH^{-1} \langle [\psi^n], [w] \rangle_{\Gamma} \\
 = & \langle \delta p^n - \frac{dp^{n, \frac{1}{4}}}{dt}, w \rangle_{\Gamma_N} - (\partial_t^2 p^n - \frac{\partial^2 p^{n, \frac{1}{4}}}{\partial t^2}, w) + \langle p_{\bar{\nu}_{\Gamma, H}}^{n, \frac{1}{4}} - p_{\bar{\nu}_{\Gamma, H}}^n, [w] \rangle_{\Gamma} \\
 & - \langle \overline{p_{\bar{\nu}_{\Gamma, H}}^n} - p_{\bar{\nu}_{\Gamma, H}}^n, [w] \rangle_{\Gamma} + (\partial_t^2 \varphi^n, w) + (\nabla(\varphi^{n, \frac{1}{4}} - \varphi^n), \nabla w) \\
 & - \langle \delta \varphi^n, w \rangle_{\Gamma_N} + \langle \delta \psi^n, w \rangle_{\Gamma} + c(\varphi^{n, \frac{1}{4}}, w) + \langle \frac{dp^{n, \frac{1}{4}}}{dt} - d_t p^{n, \frac{1}{4}}, w \rangle_{\Gamma_N}.
 \end{aligned} \tag{4.63}$$

Taking $w = -\delta \psi^n$ in equation (4.63), similarly to the derivation of equation (4.14), we have

$$\text{the left-hand side of equation (4.63)} = \frac{1}{2\Delta t} \{ \|\psi^{n-1}\|_{\mathcal{E}_1}^2 - \|\psi^n\|_{\mathcal{E}_1}^2 \}. \tag{4.64}$$

We analyze the terms on the right-hand side of equation (4.63) one by one to obtain

$$|c(\varphi^{n, \frac{1}{4}}, -\delta \psi^n)| \leq C \{ \|\partial_t \psi^n\|^2 + \|\partial_t \psi^{n-1}\|^2 \} + C \{ \|\varphi^{n+\frac{1}{2}}\|^2 + \|\varphi^{n-\frac{1}{2}}\|^2 \}, \tag{4.65}$$

$$| \langle \delta \varphi^n, -\delta \psi^n \rangle_{\Gamma_N} | \leq C \{ \|\partial_t \varphi^n\|^2 + \|\partial_t \varphi^{n-1}\|^2 \} + C \{ \|\partial_t \psi^n\|^2 + \|\partial_t \psi^{n-1}\|^2 \}, \tag{4.66}$$

$$| \langle \delta \psi^n, -\delta \psi^n \rangle_{\Gamma_N} | \leq C \{ \|\partial_t \psi^n\|^2 + \|\partial_t \psi^{n-1}\|^2 \}, \tag{4.67}$$

$$| \langle \frac{dp^{n, \frac{1}{4}}}{dt} - d_t p^{n, \frac{1}{4}}, -\delta \psi^n \rangle_{\Gamma_N} | \leq C \{ \|\partial_t \psi^n\|^2 + \|\partial_t \psi^{n-1}\|^2 \}, \tag{4.68}$$

$$| \langle \delta p^n - \frac{p^{n, \frac{1}{4}}}{dt}, -\delta \psi^n \rangle_{\Gamma} | \leq C(\Delta t)^3 + C \{ \|\partial_t \psi^n\|^2 + \|\partial_t \psi^{n-1}\|^2 \} \tag{4.69}$$

from equation (4.53).

Combining the above analysis, and by the same argument to derive equation (4.57), we see

$$\begin{aligned}
 \lambda^n \|\psi^{n-1}\|_{\mathcal{E}_1}^2 & \leq C \|\rho^N\|_{\mathcal{E}_1}^2 + C \Delta t \sum_{l=n}^N \{ \|\partial_t \psi^l\|^2 + \|\partial_t \psi^{l-1}\|^2 + \|\nabla \psi^{l-\frac{1}{2}}\|^2 + \|\nabla \psi^{l+\frac{1}{2}}\|^2 \} \\
 & + C \Delta t \sum_{l=n}^N \{ (\Delta t)^3 + \|\partial_t^2 \varphi^l\|^2 + (\Delta t)^2 \|\nabla \partial_t^2 \varphi^l\|^2 + \|\varphi^{l+\frac{1}{2}}\|^2 + \|\varphi^{l-\frac{1}{2}}\|^2 \\
 & + \|\partial_t \varphi^l\|^2 + \|\partial_t \varphi^{l-1}\|^2 \} + CH^5.
 \end{aligned} \tag{4.70}$$

Similarly to **Part 1**, by the discrete Gronwall lemma and Lemmas 3.1 and 3.2, we obtain

$$\begin{aligned}
 & \frac{1}{2} \|\partial_t \psi^{n-1}\|^2 + C_0 \|\psi^{n+\frac{1}{2}}\|^2 + c \|\psi^{n+\frac{1}{2}}\|^2 \\
 \leq & C \|\rho^N\|_{\mathcal{E}_1}^2 + C \Delta t \sum_{l=n}^N \{ (\Delta t)^3 + \|\partial_t^2 \varphi^l\|^2 + (\Delta t)^2 \|\nabla \partial_t^2 \varphi^l\|^2 \\
 & + \|\varphi^{l+\frac{1}{2}}\|^2 + \|\varphi^{l-\frac{1}{2}}\|^2 + \|\partial_t \varphi^l\|^2 + \|\partial_t \varphi^{l-1}\|^2 \} + CH^5.
 \end{aligned} \tag{4.71}$$

Hence, similarly to prove Lemma 3.2 and equation (4.43), we finally prove estimate (4.44) exist. $\square$

By the results of Lemmas 4.3, 4.4 and 4.7, we obtain the following error theorem.

Theorem 4.8. *Let $\{y, p, u\}$, $\{Y, P, U\}$ be the solutions of the optimality system (2.2)-(2.4) and the full discrete schemes (3.6)-(3.8), respectively. Assuming that the conditions in Lemmas 4.3, 4.4 and 4.7 be held, there exists a positive constant C independent of h , h_U and Δt such that*

$$\max_{1 \leq n \leq N} \|\partial_t(y - Y)^n\| + \max_{1 \leq n \leq N} \|y^n - Y^n\| \leq C\{h_U + h^2 + H^{5/2} + (\Delta t)^2\}, \quad (4.72)$$

$$\max_{1 \leq n \leq N} \|\partial_t(p - P)^n\| + \max_{1 \leq n \leq N} \|p^n - P^n\| \leq C\{h_U + h^2 + H^{5/2} + (\Delta t)^2\}, \quad (4.73)$$

provided that $\Delta t \leq C_1 H$, where constant C_1 is defined by Lemma 3.2.

Remark 4.1. From Theorem 4.8, we can know that the full discrete schemes (3.6)-(3.8) have convergence orders on Δt , h and H as same as that of [Sun and Ma (2010)]. Since the schemes use implicit Galerkin methods in the sub-domains and explicit flux calculations on the inter-domain boundary Γ by an integral mean method. The time step constraint $\Delta t \leq C_1 H$ in Lemma 3.2 is still needed to preserve stability, which is similar to that of reference work [Dupont (1973)].

5 Conclusions

We have presented a non-overlapping DDM to solve optimal boundary control problems governed by wave equations with absorbing boundary condition. An integral mean method is utilized to present an explicit flux calculation on the inter-domain boundary in order to communicate the local problems on the interfaces between subdomains, which helps to compute the local problems on each subdomain fully parallel. We establish the full discrete schemes for solving these local problems, and prove the stability of the schemes. In Theorem 4.8, a priori error estimates are derived for the state, co-state and control variables that show the full discrete schemes (3.6)-(3.8) have convergence orders on Δt , h and H as same as that of [Sun and Ma (2010)].
