

**SDI FINAL EVALUATION FORM 1.1****PART 1:**

Journal Name:	Journal of Advances in Mathematics and Computer Science
Manuscript Number:	Ms_JAMCS_42164
Title of the Manuscript:	Numerical Study of Viscous Dissipation and Temperature Dependent Viscosity on MHD Free Convection Flow Over a Sphere with Heat Conduction
Type of Article:	Original Research Article

PART 2:

FINAL EVALUATOR'S comments on revised paper (if any)	Authors' response to final evaluator's comments		
In line 140, the word programme, I think makes reference to program, please check. The phrase : "Here programme has been used Lahey Fortran 90" is not well written, I suggest: "The program used was developed with Lahey Fortran 90" or something like that. The sentence : "To satisfy the boundary conditions and also use of worthy values of various paprameters to determine the solution is uniformly convergence" in lines 149 and 150 has redaction problems, is quit confusing. Even so, I consider the answer of the authors valid, but it has to be well written in the article final version. I suggest a full English style review in the text. There are still some failures in the way the manuscript is written. Authors mention Tecplot-10 was used for graphical representation in their answers, but in the manuscript there is not any mention to this. In nomenclature: <table border="1"> <tr> <td>Nu_x</td><td>Local heat transfer coefficient</td></tr> </table> But Nu_x is a dimensionless relation, which mean this is a form of the Nusselt number?, please confirm, if is that the case it must be adjusted.	Nu_x	Local heat transfer coefficient	
Nu_x	Local heat transfer coefficient
