

Editor's Comment:

Regarding the final decision for the article titled "**Nutritional Factors Associated with Breast Cancer at Gaza Strip - Palestine: A Hospital Based Study**", number Ms_JAMPS_24778

In my opinion, it is non logic to publish such paper without careful re-revising. It contains more than 30 table and 7 non-important figures. Great bulk of the study was away from its targets, the authors discussed in details the relation between cancer breast and demographic data, the matter which should be summarized. The authors did not mention in the methodology their methods to assess the patients' dietary intake. Did they use 24 hours or 7-day recall dietary study, there was overlap between qualitative and quantitative dietary intake. The article was too long without adding novel or interesting data and documented by few recent references. Lastly, the authors' responses to the reviewers were non-satisfactory.

I hope to revise the article by the authors according to the reviewers' remarks to become more interesting for the readers and proportionate with the high quality of the journal
