

Editor's Comment:

There are many grammatical and typographical errors throughout the different sections of the manuscript and the manuscript should be improved by adding some significant findings.

1. At lines-14, "level" should be corrected to "levels".
2. At lines-32, 33, the sentence "Excess iron can cause function interference of various organs, including parathyroid gland" should be clarified and better corrected to "Excess iron can cause oxidative stress through production of highly reactive hydroxyl ($\cdot\text{OH}$) radicals, which cause oxidative damage and dysfunction of various organs, including parathyroid gland".
3. At lines-34-37, the mechanisms by which parathyroid hormone keeps blood calcium should be clarified and mentioned in detail and better corrected to "parathyroid hormone keeps blood calcium levels within normal range by increasing serum Ca^{+2} , by facilitating absorption of Ca^{+2} ions in gastrointestinal tract, or by calcium reabsorption and phosphate excretion in the kidney, and increasing calcium absorption from bone, and also plays a role in the formation of active vitamin D (1, 25 dihydroxyvitamin D) in the kidney".
4. At line-107, "patient" should be corrected to "patients".
5. At line-127, the sentence "These results agree with those study by" should be better corrected to "These results are in agreement with those reported by".
6. At line-128, "There is interesting result in our study that found only calcium is lower compared to control" should be corrected to "There is an interesting result in our study, showing that only calcium parameter is lower compared to control".
7. At lines-131-134, as a new sentence "whether this lower level of calcium only because of citrate toxicity due to repeated blood transfusion or might be calcitonin has important role in this condition" should be corrected to "Whether this lower level of calcium is only because of citrate toxicity due to repeated blood transfusion or due to the assumption that the calcitonin hormone has an important role in this condition, has not yet understood".
8. At line-140, "phosphorus, vitamin D and PTH level are not differ significantly" should be corrected to "phosphorus, vitamin D and PTH levels do not differ significantly".
9. At line-141, "there are no significant correlation" should be corrected to "there are no significant correlations".
