PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
Compulsory REVISION comments	This paper is a retrospective designed study analysing histopathologic results of foreskin after adult circumcision. The authors conclude that there is no benefit in sending non-suspicious looking foreskin to pathology for their study sample. This approach has been shown to be cost saving. Considering 4 cancer patient of 123 suspicious looking foreskin they recommend sending tissues to be analysed. Penile cancer is rare and this study uniquely address foreskin analyses of different risk groups. There are several practice patterns in the world and many physician never send foreskin to pathology. This study underlines who are at risk factors and whom to be analysed. Although the incidence of SCC they found subject to change in different geographical areas, any suspicious looking foreskin should have a histopathologic evaluation is stressed in the article. I found the article worth publishing as it is and will be a guide to clinicians doing adult circumcision and add contribution to current literature.	
Minor REVISION comments	Please explain initials in parenthesis : NHS, BXO	
Optional/General comments
