SDI Review Form 1.6

PART 1: Review Comments

	Reviewer's comment	Author's comment <i>(if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)</i>
<u>Compulsory</u> REVISION comments	The candidate should stress on the variable anatomic sites and age of occurrence of the tumour	A statement has been made indicating that synovial sarcoma can occur in various sites without mentioning them.
<u>Minor</u> REVISION comments	Mention of the gross, radiologic and microscopic appearance is important, especially the monophasic and biphasic patterns as well as the poorly differentiated form	A further section has been included in the general comments which has addressed some of these points
<u>Optional/General</u> comments	Of utmost importance is to mention the immunohistochemical and molecular profile of the tumour as well as the main lines of treatment and prognosis	In view of the fact that synovial sarcomas of the prostate gland are extremely rare I have not added any more discussion with regard to more facts on immunohistochemical and molecular main lines of treatment with regard to synovial sarcoma of the prostate but I have included some narrations related to treatment of synovial sarcomas on the whole and molecular profile.
