

Editorial comments:

The manuscript has been pretty much improved according to the reviewers' directions.

However, I found some problems as follows;

1. Figure 1.

This is a core needle biopsy sample, so the legend 'Fine needle aspiration~~' is not correct.

What is the final diagnosis? Put the diagnosis in the legend.

If the diagnosis is a follicular lymphoma, replace the photo.

There is no nodular or follicular infiltrates at all.

2. Figure 2.

Cellular detail is indiscernible, so the quality should be improved (recommended to magnify).

3. Figure 3.

This CD-20 IHC staining has a strong non-specific background staining.

There is no detectable CD-20 positive (cytoplasmic staining) tumor cells (lymphocytes).

The majority of positive reaction is a background stroma/framework.

So, the photo should be replaced.

4. The patient(s) in Fig.1~Fig.3 are (is) the same patient?

Please describe the fact.

Author's feedback:

Figure 1: We correct “the legend 'Fine needle aspiration” and replace it by “core needle biopsy sample”

We add the diagnosis which is “diffuse large B-cell lymphoma”

Figure 2: We replace the figure with a second one with high magnification

Figure 3: We repeat the immunohistochemical study with CD 20 anti body and we take another figure with high magnification. This case is the same in figure 1, it concerns primary diffuse large B cell lymphoma
