

Editor's comments:

Regarding the article here are my views :

There are few corrections yet possible and are required to be made so as to make this article worthwhile publishing in this esteemed, high standard journal.

The topic chosen is very much interesting, but the approach could have been better. Regarding the mention of risk factors and pathogenesis of the cancer are done in the conclusion, but it should be discussed well in the article before concluding.

As mentioned during article review process by one of the reviewers, it can be mentioned in article that further and larger study is required to prove the correlation of age and cancer.

Also in the graphs, the details are not explained.

Kindly consider editing and reviewing further before final publication.

Author's feedback:

Thanks Managing Editor, for your useful comments for my article. I would like to exposition the notice about this article:

1)The risk factors and pathogenesis were reported in introduction and discussion ,but not dealt with in results ,therefore deleted from conclusions .

2) This article reported that the most cases of colorectal cancer recorded in ages (51-60) years old and not mean common. Our results depend upon our data that obtained from hospital in my city.

3) The graphs in this study were explanted and re-corrected again.
