

Editor's Comment:

- I found no problem of accepting this research paper for its important information and recommendations for scientific society and was highly professionally and linguistically written, especially the information about economics of groundnut seed production and to specify the factors that are discriminating the seed production from grain production. Number of farmers used in the survey is quite enough to draw the conclusion satisfactorily.
- The organization of the manuscript into sections and subsections was very well done and paper arrangement is logical and accurate.
- The methodology used is scientifically appropriate and accurate results are obvious and I think could be reproducible.
- The only defect is the part of "Discussion", which needs some more elaboration using some Literature supporting those information and results coming out of the paper.
- However, some minor errors were noticed, especially those reported by Rev. 2 as follows and need to be corrected:
 - o In "Introduction": Line 39 – (FAOSTAT, 2016), Line 40 - (ICRISAT, 2016) and Line 47 - (IIOR, 2016) are missing in "References". In "Results and discussion" part Discussion is missing. This part of the article should be strengthened.

The paper was given high ranking points between [8-9](#) by the two reviewers, and I also give it 8.5 (accepted with minor changes).

Generally, I find no hesitation of recommending this research paper (Ms_AJEA_29405) for publication after making those minor changes in our American Journal of Experimental Agriculture. It will be a good addition to the Journal reputation.
