

Editor's Comment:

1. *"Garlic is not widely used as human food because it gives a repulsive odour and the taste is pungent"* is this information correct or not? If it is true, you must give reference/s...
2. The content of allicin and alliin in garlic changes from garlic to garlic. For a more scientific result, garlic could be analyzed.
3. It should be given just a Control Column in Table 1. Don't need to other groups, because of content of them is same. "Group 2: 2.0g/kg Garlic; Group 3: 3.0g/kg Garlic and Group 4: 4.0g/kg Garlic" could be given as a information under the table.
4. Superscripts given on tables need to be checked.

Author's feedback:

1. *"Garlic is not widely used as human food because it gives a repulsive odour and the taste is pungent"* is quite correct. However, the acceptability of garlic as part of condiment in human nutrition varies among races, tradition and eating habit. The reference has been cited as suggested.
2. *Garlic has been analyzed sufficiently and the literatures provided in this study.*
3. *Table 1 has been given just one control column and the other diets (2, 3 and 4) are explained in the footnote with the level of garlic powder additive included.*
4. *Superscripts have been adequately checked to be correctly used.*
