

Editor's Comments:

1. Title of Table 1 (line 178-180). Should say: "Characterization of the total sample, current users of T & CM and users in general, by sex, nationality, education and work. Qassim province, 2016".
2. Line 251: "In addition to other independent reasons, ..." is a very broad phrase. What other factors are you referring to?
3. Line 258-262: very confusing drafting. The meaning of the phrase is not understood.

Author's Feedback:

1. Characterization of the total sample, current users of T & CM and users in general, by sex, nationality, education and work, Qassim province, 2016".
2. Such as easy accessibility, cost-effectiveness, mostly no adverse effects and no benefits from modern medicine.
3. Conversely females being religiously conservative and requiring mahram (a person legally married to her or legally related persons but not allowed to marry her) tend not to visit frequently PHCs in Qassim province, and therefore, they were underrepresented in the present study. Unlike the present study (29% of participants used religious therapies), spiritual therapies (prayers and reciting from the Holy Quran) were most frequently used in other studies (up to 76% of study subjects).

These responses are incorporated into the text highlighted by same color.
