Subject: Re:Request for final decision for manuscript number 2013\_BJPR\_3256

I had carefully read the revision and the authors response. At present manuscript, the authors present the regulated effects of Capsicum frutescens supplemented diet (C.F.S.D.) on fasting blood glucose level and biochemical parameters in alloxan induced diabetic wistar rats. Although the research was novel for Capsicum frutescens, however, the following question should be seriously consider:

The authors feedback:

At present abstract, there are still antioxidative stress contents. Although there were many antioxidant of Capsicum frutescens, however, the abstract only involving in the authors' research.

**The revision:**

1. Abstract: the conclusion should be deduced by the present results, the authors must delete the oxidative stress
2. Drug administration: the authors confirmed that the method is twice daily for 21 day, and provide the constitution of food, however, how many food were treated to the rat every time?
3. Group: it is very difficult to understand. "non diabetic that were not induced with diabetes (which served as positive control)", how to understand the positive control in the manuscript?
4. Abbreviation is disturbance: such as 1% and 2% C.F., and 1% and 2% C.F.S.D.
5. The discussion should be highlighted on the results. Especially, the authors should delete the first paragraph.
6. Conclusion: this is the same question as 1.
7. The language should be widely revised. Such as "It is against this background that this study was designed" should be replaced with "The present study was designed depending on the background".
8. Introduction: please rewrite the introduction, first, the authors can introduce the diabetic, and then involve in the Capsicum frutescens.

According to the present condition, the authors should be revised the manuscript again, and then consider to receive.
