PART 1: Review Comments

	Reviewer's comment	Author's comment (if agreed with reviewer, correct the manuscript and highlight that part in the manuscript. It is mandatory that authors should write his/her feedback here)
<u>Compulsory</u> REVISION comments	Please clarify if there was any recruiting bias for individuals with ASD who had GI disorders, or if the participants represent a general ASD group. For the CARS, the categories are "mild-to-moderate" and "severe", not "mild" and "moderate" Were 6-GSI scores collected on the controls? Better to calculate correlation of 6-GSI with CARS, rather than an arbitrary splitting of the ASD into two groups according to CARS.	The participants represents a general ASD group. They were selected haphazard Yes you are right None of the control had GIT problem. They are selected healthy controls Yes you are right
<u>Minor</u> REVISION comments		
<u>Optional/General</u> comments	Overall, this is well-written and well-organized paper on a simple measurement of sutterella in ASD vs. controls. The results are interesting, and there is a good discussion/interpretation of the results
