Editor's Comment:

This article is a very big complex job that concerns the treatment of quantum physics in a phase space. I think that the functions used (version of the Schrödinger equation, equation de Klein-Gordon, Peano curves, ect...) are developed with method and the mathematical formalization appears to be correct. However, I am surprised that the last cited references date of 2010, because this area is very worked currently. Recent references would allow the readers to have a better understanding of the work. In my opinion, this is necessary to publish the article. Anyway, I think it would be wise to get another opinion on this text before publishing it.
