

Editor's Comment:

The manuscript cannot be accepted in the present form.

In the manuscript, there are many statements with further predictions without proof of which the author subsequently deduces certain conclusions. The general picture of the author's world looks smeared. I strongly recommend that the author adds the section "Results", or "Discussion", in which he will show the real results that have been achieved in his study. After that the manuscript can be accepted for publication in SCIENCEDOMAIN international.

P.S. Besides, the author research intersects in some aspects with the results presented in a book entitled Structure of Space and the Submicroscopic Deterministic Concept of Physics by V. Krasnoholovets. Is it possible for the author to read the book? This will allow the author to improve some of the formulations and also results.
